## HYDRAULIC SYSTEM STANDARD 3042, 3044, 3054

The hydraulic system of the 3042/44/54 includes one or more hydraulic pumps, a hydraulic control valve, lift and tilt cylinders, oil cooler, hydraulic oil reservoir and related plumbing.

Oil is drawn from the reservoir through a 100-mesh suction screen by a gear pump driven off the engine on a common drive shaft through the hydraulic pump. Oil is fed to the three-speed, open-center control valve where it is distributed to the lift, tilt and auxiliary circuits as determined by the foot controls with hand-operated auxiliary, or optional hand controls with foot-operated auxiliary. Return oil from the valve body and cylinders (and attachment where used) is fed through an oil cooler, a return-line 7-micron filter and back to the reservoir.

The control valve has a safety interlock system, connected to the seat belt, restraint bar (if equipped) and seat. When the operator unlatches the seat belt or rises off the seat, and raises the restraint bar, voltage to the valve spool solenoid is shut off, causing the hydraulic controls to lock and the engine to shut off, which prevents movement of the lift arm, bucket, and wheels. To release the spools, the operator must fasten the seat belt and have restraint bar down (if equipped).

### WARNING

The safety interlock system is not meant to prevent movement of the lift arm when people are under it. Always use the lift arm stop for this purpose.

An optional adjustable self-lowering valve connected between the top end of the lift cylinder and the base end of the lift cylinder allows the bucket to self-level as the bucket arm is raised.
