Cystic Fibrosis Pulmonary Infections: Lessons from Around the World Adolf Bauernfeind, Melvin I. Marks, Brigitta Strandvik, 2012-12-06 Infection of the lower respiratory tract is a major determinant of the course of cystic fibrosis Although numerous efforts have been made to elucidate the specific mechanisms predisposing the respiratory mucosa of cystic fibrosis patients to infection so far no clinically relevant procedures for completely effective prevention or control of infection have resulted Hence in dealing with infections in cystic fibrosis we continue to rely mainly on antimicrobials Antiinfective measures are inseparably correlated with microbiology and the quality of antiinfective therapy directly reflects the quality of microbial monitoring Validated guidelines for microbiologic testing and antiinfective use need to be developed and made available to all health providers and their cystic fibrosis patients Several years ago the editors cochaired a symposium at the International Congress of Chemotherapy on the Global Perspectives of Microbiological and Clinical Infectious Diseases in Patients with Cystic Fibrosis During this half day symposium the editors heard reports from several countries around the world with an alarming range of survival for patients with cystic fibrosis This sent a dramatic message to us that the understanding of this disease its diagnosis management and prevention was different in various countries and that patients may be inconsistently served That is how our journey began

Pignata, Ana E. Sousa, 2015-12-07 The pathogenic mechanisms underlying primary T cell disorders are mainly related to molecular alterations of genes whose expression is intrinsic to hematopoietic cells However since the differentiation process requires a crosstalk among thymocytes and the thymic microenvironment molecular alterations of genes involved in the differentiation and functionality of the stromal component of the thymus may lead to a severe T cell defect or failure of central tolerance as well The first example of severe combined immunodeficiency SCID not related to an intrinsic alteration of the hematopoietic cell but rather of the thymic epithelial component is the Nude SCID phenotype inherited as an autosomal recessive disorder whose hallmarks are the T cell defect and the absence of the thymus The clinical and immunological phenotype is the human equivalent of the murine Nude SCID syndrome which represents the first spontaneous SCID identified in nude mice in 1966 For over 3 decades studies of immune system in these mice enormously contributed to the overall knowledge of cell mediated immunity in the assumption that the athymia of these mice was solely responsible for the T cell immunological defect This syndrome is due to mutations of the transcription factor FOXP1

belonging to the forkhead box gene family which is mainly expressed in the thymus and skin epithelial cells where it plays a critical role in differentiation and survival. An alteration of the thymic structure is also a feature of the DiGeorge syndrome DGS which has been long considered the human counterpart of the nude mice phenotype. This syndrome is frequently associated to a deletion of the 22q11 region which contains approximately 30 genes including the TBX1 gene which is responsible for most of the clinical features of DGS in humans and mice. In this syndrome common manifestations are cardiac malformations, speech delay, hypoparathyroidism and immunodeficiency even though the immunological hallmarks of the T cell defect in DiGeorge syndrome are profoundly different from those reported in human. Nude SCID. The divergence of the phenotype among these 2 entities raised the possibility that the FOXP1 transcription factor represents the real key stromal molecule implicated in directing the hematopoietic stem cell toward a proper T cell fate. Thymic stromal component of the primary lymphoid organ is also required to negatively select the autoreactive clones, a process driven by the expression of tissue specific antigens (TSA) by medullary thymic epithelial cells (mTECs). The expression of genes encoding TSA antigens is mediated by autoimmune regulator (AIRE) gene encoding a transcription factor expressed in mTECs. Molecular alterations of this gene are associated to autoimmune polyendocrinopathy, candidiasis, ectodermal dystrophy (APECED), a rare autosomal disorder which may be considered the prototype of an autoimmune disease due to the failure of central tolerance homeostasis. All these experiments of nature led to unravel novel pathogenic mechanisms underlying inherited disorders of immune system and of note to clarify the pivotal role of epithelial cells in the maturation and education process of T cell precursors. *Philosophical Problems of Modern Biology* Jan Kamaryt, 1965

Boushey, Mario Ferruzzi, Linda Delahanty, 2017-04-28 Nutrition in the Prevention and Treatment of Disease Fourth Edition is a compilation of current knowledge in clinical nutrition and an overview of the rationale and science base of its application to practice in the prevention and treatment of disease. In its fourth edition, this text continues the tradition of incorporating new discoveries and methods related to this important area of research. Generating and analyzing data that summarize dietary intake and its association with disease are valuable tasks in treating disease and developing disease prevention strategies. Well founded medical nutrition therapies can minimize disease development and related complications. Providing scientifically sound, creative and effective nutrition interventions is both challenging and rewarding. Two new chapters on metabolomics and translational research which have come to be used in nutrition research in recent years. The new areas of study are discussed with the perspective that the application of the scientific method is by definition an evolutionary process. A new chapter on Genetics and Diabetes which reviews the latest

research on causal genetic variants and biological mechanisms responsible for the disease and explores potential interactions with environmental factors such as diet and lifestyle Includes all major omics the exposome metabolomics genomics and the gut microbiome Expands the microbiota portions to reflect complexity of diet on gut microbial ecology metabolism and health
