*Team Sports Training* Javier Mallo,2020-03-10 Team Sports Training The Complexity Model presents a novel approach to team sports training examining football soccer rugby field hockey basketball handball and futsal through the paradigm of complexity Under a traditional prism these sports have been analyzed using a deterministic perspective where the constituent dimensions of the sportsmen were independently examined and treated in isolation It was expected that the body worked as a perfect machine and once all the components were maximized the sportsmen improved their performance If the same closed recipe was applied to all the players that formed part of the squad the global team performance was expected to be enhanced As much as these reductionistic models seem coherent when contrasted in practice we see that the reality of team sports is far more different from the closed conditions in which they were idealized Team sports contain variable heterogeneous and non linear constrains which require the development of a different logic to organize their training During the last years ecological psychology the dynamical systems theory or the constraints led approach have opened interesting fields of research from which many conceptual foundations can be applied to team sports Based in this contemporary framework the current book presents the study of the players and the teams as complex systems using coordination dynamics to explain the emergence of the self organisation episodes that characterize them In addition this thinking line provides the reader with the ability to apply all these innovative concepts to their practical training scenarios Altogether it is intended to challenge the reader to re think their training strategy and to develop an original theory and practice of training specific to team sports

**Can't Get You Out of My Head: Brain-Body Interactions in Perseverative Cognition** Cristina Ottaviani, Julian F. Thayer, Bart Verkuil, Hugo D. Critchley, Jos F. Brosschot, 2018-02-16 Perseverative cognition is defined as the repetitive or sustained activation of cognitive representations of past stressful events or feared events in the future and even at non clinical levels it causes a fight or flight action tendency followed by a cascade of biological events starting in the brain and ending as peripheral stress responses In the past decade such persistent physiological activation has proven to impact individuals health potentially leading to somatic disease As such perseverative cognition has recently been proposed as the missing piece in the relationships between stress psychopathology and risk for health Perseverative cognition is indeed a hallmark of conditions such as anxiety and mood disorders that are at increased though still unexplained cardiovascular risk Although the pivotal role of ruminative and worrisome thoughts in determining the onset and maintenance of psychopathological disorders has been acknowledged for a long time its effects on the body via reciprocal influences between mental processes and the body's physiology have been neglected Moreover perseverative cognition is definitely not restricted to psychopathology it is extremely common and likely even omnipresent pervading daily life The objective of the Research Topic is to provide an interdisciplinary examination of cutting edge neuroscientific research on brain body signatures of perseverative cognition in both healthy and psychopathological individuals Despite the evident role of the brain in repetitive thinking and the assumption that our mind is embodied brain body pathways from perseverative cognition to health risk have remained largely unexplored
