

How Genes Work

Each **chromosome** contains thousands of genes. A **gene** is a section of a DNA strand that is made up of a series of bases which contains the information for cells to make one specific protein. **Proteins** in cells act as messengers and help to determine the traits of an organism such as the different shapes, sizes, colors and other features found in living organisms.

DNA Structure

Chromosomes are made up of **DNA**. **DNA**, or **deoxyribonucleic acid**, is the hereditary material in humans and almost all other organisms. The hereditary information in DNA is stored as a code made up of four chemical bases: **adenine (A)**, **guanine (G)**, **cytosine (C)** and **thymine (T)**. The order, or sequence, of these bases, determines the information available for building and maintaining an organism, similar to the way in which letters of the alphabet appear in a certain order to form words and sentences. DNA bases pair up with each other, A with T and C with G, to form units called **base pairs**.

Copying DNA

The amount of **DNA** doubles during the beginning of **cell** division. The double stranded DNA unwinds and each strand becomes a **template** on which a new strand is formed.

Complementary bases pair up with the exposed bases on the template strand.
