Moreover there is an increasing need for emerging intelligent services like positioning and sensing in the future intelligence society. Recent years have witnessed the growing research interests and activities in the communication and intelligent services in the optical wireless spectrum as a complementary technology to more established radio frequency RF based systems to overcome the spectrum sparsity and increase data rates in crowded locations due to the limited transmission range and interference. The OWC technology offers advantages such as free license, wide bandwidth, inherent security, no RF electromagnetic interference, and immunity to electromagnetic interference. The attractive applications of the optical spectrum include ultra violet tactical communication, blue green underwater communication, visible light positioning, and vehicular communication sensing in intelligent transportation systems. The present issue, as named Visible Light Communication and Positioning, focuses on visible light communication and visible light positioning where four papers are on visible light communication and three papers are on visible light positioning. For visible light communication, the published works focus on the devices, the physical layer techniques, and the system work aspects. Besides VLC, visible light positioning works include fingerprint based indoor positioning system for multiple reflections, the impact of LED tilt on visible light positioning accuracy, and a mobile optoelectronic tracking system based on feedforward control.
