

What is mulch?

A mulch is a layer of material applied to the surface of the soil (usually a minimum of 4cm deep, ideally 7-10cm deep) for one or several of the following reasons:

- Suppress weeds
- Retain moisture
- Insulate the rooting area against sudden changes in temperature
- Improve the appearance of bare soil
- Deter some pests
- Provide additional organic matter to improve the soil structure

There are a few disadvantages of using mulch:

- With many mulches it's difficult to get them to stay in one place and you often find they 'drift' to other parts of the garden, such as the lawn
- Mulches may need to be topped up on an annual basis, which can become expensive over time
- Some mulches risk bringing toxins, pests or diseases into the garden, or altering the soil's pH levels

Many different materials can be used as mulch, a selection of which are discussed below. An alternative to mulching bare soil is to grow ground cover plants, which provide most of the benefits of a mulch without some of the disadvantages.

Before applying a mulch, ensure that all perennial weeds and their roots have been removed as these can work their way through the toughest of mulches. Don't apply the mulch when the ground is cold or frozen (otherwise the mulch will keep the cold in and prevent the soil warming up) and ensure the soil is moist before applying it. It's best to apply mulch between [mid-spring](#) and autumn.
