

Mendelian Genetics – Pre Lab

Through the studies of the garden pea in the 19th century, Gregor Mendel derived the principles that form the basis for some of the modern study of genetics or inherited traits. These principles are the ideas of dominance, segregation of alleles, and independent assortment.

Genetic studies in Mendel's day and today are based on the comparison of observed prevalence of certain traits to expected prevalence of the same traits. Observed values are obtained by simply counting the trait in individuals to the study population. Expected values are predicted statistically by using a Punnett square or some other type of predictor. Mendel was one of the first biologists to apply statistics to the evaluation of data.

1. What is meant by a "dominant trait" in classical genetics? Explain and give an example.
2. What is a co-dominant trait? Explain and give an example.
3. What is meant by segregation of alleles and independent assortment?
4. What is a phenotype? A genotype?
5. Draw a Punnett square showing the possible offspring of two parents, both with a heterozygous genotype for the same trait. Use alleles B and b.
6. Assume the dominant characteristic for the B gene is brown color and the recessive characteristic is white. Then, according to the square you drew above,
 - a. What are the types and ratio of phenotypes in the offspring?
 - b. What are the types and ratio of genotypes in the offspring?
7. Does the Punnett square show observed numbers of offspring or expected numbers of offspring? Describe an example to illustrate your answer.
