Mathematical Perspectives on Neural Networks Paul Smolensky, Michael C. Mozer, 2013-05-13 Recent years have seen an explosion of new mathematical results on learning and processing in neural networks This body of results rests on a breadth of mathematical background which even few specialists possess In a format intermediate between a textbook and a collection of research articles this book has been assembled to present a sample of these results and to fill in the necessary background in such areas as computability theory computational complexity theory the theory of analog computation stochastic processes dynamical systems control theory time series analysis Bayesian analysis regularization theory information theory computational learning theory and mathematical statistics Mathematical models of neural networks display an amazing richness and diversity Neural networks can be formally modeled as computational systems as physical or dynamical systems and as statistical analyzers Within each of these three broad perspectives there are a number of particular approaches For each of 16 particular mathematical perspectives on neural networks the contributing authors provide introductions to the background mathematics and address questions such as Exactly what mathematical systems are used to model neural networks from the given perspective What formal questions about neural networks can then be addressed What are typical results that can be obtained and What are the outstanding open problems A distinctive feature of this volume is that for each perspective presented in one of the contributed chapters the first editor has provided a moderately detailed summary of the formal results and the requisite mathematical concepts These summaries are presented in four chapters that tie together the 16 contributed chapters three develop a coherent view of the three general perspectives computational dynamical and statistical the other assembles these three perspectives into a unified overview of the neural networks field Tourism Research Methods Greg Richards, Wil Munsters, 2010 The consumption of culture is one of the most important aspects of tourism activity Cultural tourism includes experiencing local culture traditions and lifestyle participation in arts related activities and visits to museums monuments and heritage sites This book reviews a wide range of qualitative and quantitative research methods applied to the field of cultural tourism including surveys mystery tourist visits visitor tracking grand tour narratives collage researcher created video photo based interviews ethnographic and actor network approaches It provides a practical guide on how to conduct research as well as a discussion and evaluation of the methods Routledge Reviewer's Guide to Mixed Methods Analysis Anthony J.
