Holland,2014-01-10 An overarching framework for comparing and steering complex adaptive systems is developed through understanding the mechanisms that generate their intricate signal boundary hierarchies Complex adaptive systems cas including ecosystems governments biological cells and markets are characterized by intricate hierarchical arrangements of boundaries and signals In ecosystems for example niches act as semi permeable boundaries and smells and visual patterns serve as signals governments have departmental hierarchies with memoranda acting as signals and so it is with other cas Despite a wealth of data and descriptions concerning different cas there remain many unanswered questions about steering these systems In *Signals and Boundaries* John Holland argues that understanding the origin of the intricate signal border hierarchies of these systems is the key to answering such questions He develops an overarching framework for comparing and steering cas through the mechanisms that generate their signal boundary hierarchies Holland lays out a path for developing the framework that emphasizes agents niches theory and mathematical models He discusses among other topics theory construction signal processing agents networks as representations of signal boundary interaction adaptation recombination and reproduction the use of tagged urn models adapted from elementary probability theory to represent boundary hierarchies finitely generated systems as a way to tie the models examined into a single framework the framework itself illustrated by a simple finitely generated version of the development of a multi celled organism and Markov processes

Fostering Children's Mathematical Power Arthur J. Baroody,Ronald T. Coslick,1998-09-01 Teachers have the responsibility of helping all of their students construct the disposition and knowledge needed to live successfully in a complex and rapidly changing world To meet the challenges of the 21st century students will especially need mathematical power a positive disposition toward mathematics curiosity and self confidence facility with the processes of mathematical inquiry problem solving reasoning and communicating and well connected mathematical knowledge an understanding of

mathematical concepts procedures and formulas This guide seeks to help teachers achieve the capability to foster children s mathematical power the ability to excite them about mathematics help them see that it makes sense and enable them to harness its might for solving everyday and extraordinary problems The investigative approach attempts to foster mathematical power by making mathematics instruction process based understandable or relevant to the everyday life of students Past efforts to reform mathematics instruction have focused on only one or two of these aims whereas the investigative approach accomplishes all three By teaching content in a purposeful context an inquiry based fashion and a meaningful manner this approach promotes children s mathematical learning in an interesting thought provoking and comprehensible way This teaching guide is designed to help teachers appreciate the need for the investigative approach and to provide practical advice on how to make this approach happen in the classroom It not only dispenses information but also serves as a catalyst for exploring conjecturing about discussing and contemplating the teaching and learning of mathematics

Translating Euclid Gerry Stahl,2022-05-31 Translating Euclid reports on an effort to transform geometry for students from a stylus and clay tablet corpus of historical theorems to a stimulating computer supported collaborative learning inquiry experience The origin of geometry was a turning point in the pre history of informatics literacy and rational thought Yet this triumph of human intellect became ossified through historic layers of systematization beginning with Euclid s organization of the Elements of geometry Often taught by memorization of procedures theorems and proofs geometry in schooling rarely conveys its underlying intellectual excitement The recent development of dynamic geometry software offers an opportunity to translate the study of geometry into a contemporary vernacular However this involves transformations along multiple dimensions of the conceptual and practical context of learning Translating Euclid steps through the multiple challenges involved in redesigning geometry education to take advantage of computer support Networked computers portend an interactive approach to exploring dynamic geometry as well as broadened prospects for collaboration The proposed conception of geometry emphasizes the central role of the construction of dependencies as a design activity integrating human creation and mathematical discovery to form a human centered approach to mathematics This book chronicles an iterative effort to adapt technology theory pedagogy and practice

to support this vision of collaborative dynamic geometry and to evolve the approach through on going cycles of trial with students and refinement of resources It thereby provides a case study of a design based research effort in computer supported collaborative learning from a human centered informatics perspective
