Entropic Forces, Phase Separation, and Fractals Ronald Hancock, Kwang W. Jeon, 2013-12-27 International Review of Cell and Molecular Biology presents current advances and comprehensive reviews in cell biology both plant and animal. Articles address structure and control of gene expression, nucleocytoplasmic interactions, control of cell development and differentiation, and cell transformation and growth. Impact factor for 2012: 4.973. Ideas from the fields of biophysics, physical chemistry of polymer and colloid, and soft matter science have helped clarify the structure and functions of the cell nucleus. The development of powerful methods for modeling conformations and interactions of macromolecules has also contributed. The book aims to encourage cell and molecular biologists to become more familiar with and understand these new concepts and methods and the crucial contributions they are making to our perception of the nucleus. This is the first volume to present a comprehensive review of New Models of the Cell Nucleus. **Applied Spectroscopy**, 2007. Novel Materials for Carbon Dioxide Mitigation Technology Bryan Morreale, Fan Shi, 2015-06-01. Materials for Carbon Dioxide Mitigation Technology offers expert insight and experience from recognized authorities in advanced material development in carbon mitigation technology and constitutes a comprehensive guide to the selection and design of a wide range of solvent sorbent catalysts used by scientists globally. It appeals to chemical scientists, material scientists, and engineers, energy researchers, and environmental scientists from academia, industry, and government in their research directed toward greener, more efficient carbon mitigation processes. Emphasizes material development for carbon mitigation technologies rather than regulations. Provides a fundamental understanding of the underpinning science as well as technological approaches to implement carbon capture, utilization, and storage technologies. Introduces the driving force behind novel materials, their performance, and applications for carbon dioxide mitigation. Contains figures, tables, and an abundance of examples clearly explaining the development, characterization, and evaluation of novel carbon mitigation materials. Includes hundreds of citations drawing on the most recent published works on the subject. Provides a wealth of real-world examples illustrating how to bridge nano-scale materials to bulk carbon mitigation properties. **Eckert Animal Physiology** David J. Randall, Warren Burggren, Kathleen French, Roger Eckert, 2002. This classic animal physiology text focuses on comparative examples that illustrate the general principles of physiology at all levels of organisation, from molecular mechanisms to regulated physiological systems to whole organisms in their environment. This textbook is an authoritative and complete guide to the field of animal physiology which uses a threefold approach to teaching. The Comparative Approach emphasises basic mechanisms but allows patterns of physiological function in different species to demonstrate how evolution creates diversity. This approach encourages students to appreciate the underlying principles that govern physiological systems. The Experimental Emphasis helps students to understand the process of scientific discovery and shows how our knowledge of physiology continually increases. Finally, the Integrative Approach presents information about specific physiological systems at all levels of organisation, from molecular interactions to interactions between an organism and its environment.
