order to replace damaged tissues Biologic scaffolds can be produced through the removal of resident cellular populations using several tissue engineering approaches such as the decellularization method Indeed the decellularization method aims to develop a cell free biologic scaffold while keeping the extracellular matrix ECM intact Furthermore biologic scaffolds have been investigated for their in vitro potential for whole organ development Currently clinical products composed of decellularized matrices such as pericardium urinary bladder small intestine heart valves nerve conduits trachea and vessels are being evaluated for use in human clinical trials Tissue engineering strategies require the interaction of biologic scaffolds with cellular populations Among them stem cells are characterized by unlimited cell division self renewal and differentiation

potential distinguishing themselves as a frontline source for the repopulation of decellularized matrices and scaffolds Under this scheme stem cells can be isolated from patients expanded under good manufacturing practices GMPs used for the repopulation of biologic scaffolds and finally returned to the patient The interaction between scaffolds and stem cells is thought to be crucial for their infiltration adhesion and differentiation into specific cell types In addition biomedical devices such as bioreactors contribute to the uniform repopulation of scaffolds Until now remarkable efforts have been made by the scientific society in order to establish the proper repopulation conditions of decellularized matrices and scaffolds However parameters such as stem cell number in vitro cultivation conditions and specific growth media composition need further evaluation The ultimate goal is the development of artificial tissues similar to native ones which is achieved by properly combining stem cells and biologic scaffolds and thus bringing them one step closer to personalized medicine The original research articles and comprehensive reviews in this Special Issue deal with the use of stem cells and biologic scaffolds that utilize state of the art tissue engineering and regenerative medicine approaches
