

6. Use the controls at the bottom of the Color inspector to adjust any of the following:

- **Temperature:** Adjust the color temperature, in degrees kelvin, so that the image looks as natural as possible. Color temperature describes the color value of light when the image was shot (not the light's heat value). Drag the slider to the left to increase blue tones, or to the right to increase yellow-red tones. For example, if the image was shot under tungsten conditions, set the value between 2500 and 2900 degrees kelvin to white-balance it.
- **Tint:** Fine-tune the white-balance adjustment by neutralizing a remaining green or magenta tint. Drag the Tint slider to the left to add a green tint to the

image, or to the right to add a magenta tint.

- **Hue:** Use the Hue control or value slider to set a value from 0° to 360°, effectively rotating all hues in the image around the perimeter of the color wheel. A value of 0° represents the original image.
- **Mix:** Set the amount of the original image to be blended with the color-corrected image.

To reset the values for a color wheel or a value slider, click its Reset button .

 **Tip:** If you want to color correct the next or previous clip in the timeline, press Command-Right Arrow or Command-Left Arrow to move the playhead to the next or previous clip and select it. These shortcuts select clips in the same [role](#) only, so you can quickly move between video clips and skip over clips not suited for color correction (such as music or titles).

After you apply a color correction, you can copy it to another clip or group of clips. For more information, see [Copy effects and attributes between clips](#).
