Lindeke, 2009 Each year three or four Mn DOT snowplows suffer bridge box collisions while plowing These collisions can shear off the box and frame damage to the truck The box then falls onto the road surface where it becomes an immediate life threatening hazard to traffic In some cases the integrity of the bridge may also be compromised A typical collision of this type requires expenditures of 30 000 to 40 000 dollars and results in potentially dangerous delays in achieving clean pavement status along the affected snowplowing route Feasibility of linking on board GPS technology for Automatic Vehicle Location with the current bridge information database at Mn DOT BrInfo will be investigated on a plow route by route basis to create collision maps Collision avoidance then will use some primitive form of map matching In

addition a prototype warning system that serves as a bridge proximity sensor will be developed to alert the snow plow driver that he she is approaching a bridge with the box at a dangerous height This warning system is integrated in an on board box position sensor so that the driver can be alerted that the box must immediately be lowered While realizing that additional means for box height control may complicate snowplow maintenance any system that relieves the driver of cognitive overload to reduce driver stress and fatigue during plowing operating when running extended rural plow routes needs to be implemented **Flying Magazine** ,1995-03 *Sport Aviation and the Experimenter* ,1992 **Flying Magazine** ,2001-04
