Production Planning with Capacitated Resources and Congestion Hubert Missbauer,Reha Uzsoy,2020-02-26 This book presents a comprehensive overview of recent developments in production planning The monograph begins with an introductory chapter reviewing the need for these production planning models that operate by determining time phased releases of work into the facility or supply chain relating these to the Manufacturing Planning and Control MPC and Advanced Planning and Scheduling APS frameworks that form the basis of most academic research and industrial practice The extensive body of work on Workload Control is also placed in this context and proves the need for improved models with a discussion of the difficulties these approaches encounter The next two chapters present a detailed review of the state of the art in optimization models based on exogenous planned lead times and examines the cases where these can take both integer and fractional values The difficulties arising in estimating planned lead times are consistent with factory behavior which are highlighted noting that many of these lead to non convex optimization models Attempts to address these difficulties by iterative multimodel approaches that combine simulation and mathematical programming are also discussed in detail The next three chapters of the volume address the set of techniques developed using clearing functions which represent the expected output of a resource in a planning period as a function of the expected workload of the resource during that period The chapters on this subject propose a basic optimization model for multiple products discuss the difficulties of this model and some possible solutions It also reviews prior work and discuss a number of alternative formulations of the clearing function concept with their respective advantages and disadvantages Applications to lot sizing decisions and a number of other specific problems are also described This volume concludes with an assessment of the state of the art described in the volume and several directions for future work

The Physics of Submicron Structures Harold L. Grubin,2012-12-06 Research on electronic transport in ultra small dimensions has been highly stimulated by the sensational developments in silicon technology and very large scale integration

The papers in this volume however have been influenced to no lesser extent by the advent of molecular beam epitaxy and metal organic chemical vapor deposition which has made possible the control of semiconductor boundaries on a quantum level This new control of boundary conditions in ultra small electronic research is the mathematical reason for a whole set of innovative ideas For the first time in the history of semiconductors it is possible to design device functions from physical considerations involving nanoscale dimensions At the time the meeting was held July 1982 it was one of the first strong signals of the powerful developments in this area During the meeting important questions have been answered concerning ballistic transport Monte Carlo simulations of high field transport and other developments pertinent to new device concepts and the understanding of small devices from physics to function The committee members want to express their deep appreciation to the speakers who have made the meeting a success The USER project of DOD has been a vital stimulus and thanks go to the Army Research Office and the Office of Naval Research for financial support Urbana January 1984 K Hess Conference Chairman J R Brews L R Cooper Ex Officio D K Ferry H L Grubin G J Iafrate M I Nathan A F

Criticality as a signature of healthy neural systems: multi-scale experimental and computational studies Paolo Massobrio, Lucilla de Arcangelis, Valentina Pasquale, Henrik Jeldtoft Jensen, Dietmar Plenz, 2015-05-08 Since 2003 when spontaneous activity in cortical slices was first found to follow scale free statistical distributions in size and duration increasing experimental evidences and theoretical models have been reported in the literature supporting the emergence of evidence of scale invariance in the cortex Although strongly debated such results refer to many different in vitro and in vivo preparations awake monkeys anesthetized rats and cats in vitro slices and dissociated cultures suggesting that power law distributions and scale free correlations are a very general and robust feature of cortical activity that has been conserved across species as specific substrate for information storage transmission and processing Equally important is that the features reminiscent of scale invariance and criticality are observed at scale spanning from the level of interacting arrays of neurons all the way up to correlations across the entire brain Thus if we accept that the brain operates near a critical point little is known about the causes and or consequences of a loss of criticality and its relation with brain diseases e g epilepsy The study of how pathogenetical mechanisms are related to the critical non critical behavior of neuronal networks would likely provide new insights into the cellular and synaptic determinants of the emergence of critical like dynamics and structures in neural systems At the same time the relation

between the impaired behavior and the disruption of criticality would help clarify its role in normal brain function The main objective of this Research Topic is to investigate the emergence disruption of the emergent critical like states in healthy impaired neural systems **Canadian Journal of Physics** ,2012
