Autophagy in plants and algae Diane C Bassham, Jose L Crespo, 2015-05-15 Autophagy also known as macroautophagy is an evolutionarily conserved process by which cytoplasmic components are nonselectively enclosed within a double membrane

vesicle known as the autophagosome and delivered to the vacuole for degradation of toxic components and recycling of needed nutrients. This catabolic process is required for the adequate adaptation and response of the cell and correspondingly the whole organism to different types of stress including nutrient starvation or oxidative damage. Autophagy has been extensively investigated in yeasts and mammals but the identification of autophagy related ATG genes in plant and algal genomes together with the characterization of autophagy deficient mutants in plants have revealed that this process is structurally and functionally conserved in photosynthetic eukaryotes. Recent studies have demonstrated that autophagy is active at a basal level under normal growth in plants and is upregulated during senescence and in response to nutrient limitation, oxidative stress, salt and drought conditions and pathogen attack. Autophagy was initially considered as a non-selective pathway but numerous observations mainly obtained in yeasts revealed that autophagy can also selectively eliminate specific proteins, protein complexes and organelles. Interestingly, several types of selective autophagy appear to be also conserved in plants and the degradation of protein aggregates through specific adaptors or the delivery of chloroplast material to the vacuole via autophagy has been reported. This research topic aims to gather recent progress on different aspects of autophagy in plants and algae. We welcome all types of articles including original research, methods, opinions and reviews that provide new insights about the autophagy process and its regulation.

Development of Circadian Clock Functions, volume II Daisuke Ono, Takahiro J. Nakamura, Jeff Jones, Jihwan Myung, Rae Silver, 2024-07-31. The temporal order of physiological functions such as sleep/wakefulness is regulated by the circadian clock. This intrinsic clock starts ticking in the embryo and matures during development with attenuation of the clock function in the elderly, illustrated by attenuation of synchrony, entrainment and outputs of cellular circadian rhythms in the SCN. This age-related diminution can contribute to the emergence of diseases such as sleep disorders, infertility, diabetes, mental disorders, etc. Over the course of our lives, a variety of internal and external factors are under the influence of the circadian clock. This inherent developmental plasticity of the circadian system is critical for the establishment of normal bodily functions to adapt to the changing environment on earth. In mammals, the central circadian clock is located in the suprachiasmatic nucleus (SCN) of the hypothalamus. Circadian rhythms in the SCN are observed during the embryonic period and input and output pathways from the SCN are formed after birth. During postnatal development, functions of neurotransmitters in the SCN are changed, which have an influence on special temporal patterns of circadian rhythms in the SCN and output signals to the outside of the SCN. During postnatal development, properties of circadian rhythms in the SCN and its inputs and outputs can be modulated by environmental light conditions. Recent optical manipulation and imaging techniques have revealed that cell type specific functions for circadian rhythms. However, it remains unclear which cell types or networks in the brain are modulated during postnatal development and how these cells regulate circadian rhythms depending on postnatal period.

The Proteins of Plastid Nucleoids - Structure, Function and Regulation Thomas Pfannschmidt, Jeannette Pfalz, 2016-09-13. Plastids are plant cell specific

organelles of endosymbiotic origin that contain their own genome the so called plastome Its proper expression is essential for faithful chloroplast biogenesis during seedling development and for the establishment of photosynthetic and other biosynthetic functions in the organelle The structural organisation replication and expression of this plastid genome thus has been studied for many years but many essential steps are still not understood Especially the structural and functional involvement of various regulatory proteins in these processes is still a matter of research Studies from the last two decades demonstrated that a plethora of proteins act as specific regulators during replication transcription post transcription translation and post translation accommodating a proper inheritance and expression of the plastome Their number exceeds by far the number of the genes encoded by the plastome suggesting that a strong evolutionary pressure is maintaining the plastome in its present stage The plastome gene organisation in vascular plants was found to be highly conserved while algae exhibit a certain flexibility in gene number and organisation These regulatory proteins are therefore an important determinant for the high degree of conservation in plant plastomes A deeper understanding of individual roles and functions of such proteins would improve largely our understanding of plastid biogenesis and function a knowledge that will be essential in the development of more efficient and productive plants for agriculture The latter represents a major socio economic need of fast growing mankind that asks for increased supply of food fibres and biofuels in the coming decades despite the threats exerted by global change and fast spreading urbanisation

Generation of cDNA Libraries Shao-Yao Ying,2008-02-03 Since its invention and subsequent development nearly 20 years ago polymerase chain reaction PCR has been extensively utilized to identify numerous gene probes in vitro and in vivo However attempts to generate complete and full length complementary cDNA libraries were for the most part fruitless and remained elusive until the last decade when simple and rapid methods were developed With current decoding and potential application of human genome information to genechips there are urgent needs for identification of functional significance of these decoded gene sequences Inherent in bringing these applications to fruition is the need to generate a complete and full length cDNA library for potential functional assays of specific gene sequences Generation of cDNA Libraries Methods and Protocols serves as a laboratory manual on the evolution of generation of cDNA libraries covering both background information and step by step practical laboratory recipes for which protocols reagents operational tips instrumentation and other requirements are detailed The first chapter of the book is an overview of the basics of generating cDNA libraries which include the following a the definition of a cDNA library b different kinds of cDNA libraries c differences between methods for cDNA library generation using conventional approaches and novel strategies including reverse generation of RNA repertoires from cDNA libraries and d the quality of cDNA libraries

Structure and Plasticity of Protein-protein Interfaces in Factor Xa and the Androgen Receptor Eugene Hur,2006 To better understand these issues in the context of the proteolytic blood coagulation cascade the structure of factor Xa FXa was solved in complex with a M84R variant of the macromolecular protease inhibitor ecotin The structure reveals the

atomic mechanism of association Despite not possessing the recognition sequence of canonical FXa substrates ecotin binds FXa with pico molar affinity through a combination of induced fit and nonspecific secondary site interactions **Genetics of Apicomplexans and Apicomplexan-Related Parasitic Diseases** Moses Okpeku,Matthew Adekunle Adeleke,Jun-Hu Chen,2022-03-28 **A dynamic interplay between membranes and the cytoskeleton critical for cell development and signaling** Clément Thomas,Christopher J Staiger,2014-10-23 Various cellular processes underlying plant development and response to environmental cues rely on a dynamic interplay between membranes and the cytoskeleton e g vesicle and organelle trafficking endocytosis exocytosis and signal transduction In recent years significant progress in the understanding of such interplay has been achieved and several critical links between membranes and the cytoskeleton have been characterized As an example recent work has clarified how auxin promotes the reorganization of cortical actin filaments by the activation of Rho GTPase pathways and how such reorganization in turn locally modifies endocytosis and or exocytosis and directs asymmetric distribution of PIN family of auxin transporters Another recent achievement is the characterization of the Rho and microtubule driven mechanism by which the cell wall architecture is established In particular the elegant work by Oda and Fukuda Science 337 p 1333 2012 provides evidence that secondary wall patterning in xylem vessel primarily relies on two processes a local activation of the plant Rho GTPase ROP11 and a mutual MIDD1 mediated inhibitory interaction between active ROP domains and cortical microtubules Additional examples include recent genetic evidence that microtubule and actin filament interacting regulatory proteins such as MAP65 1 and capping protein function as transducers of membrane lipid signaling into changes in cytoskeleton dynamics and organization This Research Topic aims at collecting a comprehensive set of articles dealing with cellular processes involving membrane cytoskeleton interactions Its scope extends beyond the specific fields defined by the above examples and includes intracellular trafficking host pathogen interactions response to biotic and abiotic stresses and hormonal regulation of growth We hope that this Research Topic will also highlight critical questions that need to be addressed in the future We welcomed Original Research Articles Technical Methodological Advances e g analysis of cytoskeleton dynamics close to membranes Reviews and Mini Reviews that can expand our understanding of how and why membranes and the cytoskeleton interact RNAi Martin Latterich,2008-09-04 A key feature of RNAi is the highlighting of the pitfalls that can occur and how to minimize them The book also contains a complete list of abbreviations as there are many confusing terms associated with RNAi Jacket **Mergent Industrial Manual** ,2003 **Mergent OTC Unlisted Manual** ,2003 **Characterization of Rice Genes Regulating Xa21-mediated Disease Resistance** Ying Peng,2008 An Exploration Into the Mechanism of Control of the Maize Knotted1 (kn1) Gene Julio Cesar Ramirez,2007
