

Definition: A triangle is a polygon with three sides and three angles. The sum of the interior angles of a triangle is always 180° . A triangle is classified based on its sides and angles.

Types of Triangles

Triangles can be classified based on their sides and angles. The following are the types of triangles:

- Equilateral Triangle: All three sides are equal, and all three angles are equal (60° each).
- Isosceles Triangle: Two sides are equal, and the angles opposite to these sides are also equal.
- Scalene Triangle: All three sides are unequal, and all three angles are unequal.

Properties of a Triangle: The sum of the interior angles of a triangle is 180° . The exterior angle of a triangle is equal to the sum of the two opposite interior angles.

Trigonometric Ratios

Consider a right-angled triangle:

Let θ be an acute angle.

Definition:

The sine of an angle θ is the ratio of the length of the side opposite to θ to the length of the hypotenuse.

Mathematically, $\sin \theta = \frac{\text{opposite}}{\text{hypotenuse}}$

Mathematics for the Nonmathematician Morris

Kline, 1985-01-01 Practical scientific philosophical and artistic problems have caused men to investigate mathematics But there is one other motive which is as strong as any of these the search for beauty Mathematics is an art and as such affords the pleasures which all the arts afford In this erudite entertaining college level text Morris Kline Professor Emeritus of Mathematics at New York University provides the liberal arts student with a detailed treatment of mathematics in a cultural and historical context The book can also act as a self study vehicle for advanced high school students and laymen Professor Kline begins with an overview tracing the development of mathematics to the ancient Greeks and following its evolution through the Middle Ages and the Renaissance to the present day Subsequent chapters focus on specific subject areas such as Logic and Mathematics Number The Fundamental Concept Parametric Equations and Curvilinear Motion The Differential Calculus and The Theory of Probability Each of these sections offers a step by step explanation of concepts and then tests the student's understanding with exercises and problems At the same time these concepts are linked to pure and applied science engineering philosophy the social sciences or even the arts In one section Professor Kline discusses non Euclidean geometry ranking it with evolution as one of the two concepts which have most profoundly revolutionized our intellectual development since the nineteenth century His lucid treatment of this difficult subject starts in the 1800s with the pioneering work of Gauss Lobachevsky Bolyai and Riemann and moves forward to the theory of relativity explaining the mathematical scientific and philosophical aspects of this pivotal breakthrough Mathematics for the Nonmathematician exemplifies Morris Kline's rare ability to simplify complex subjects for the nonspecialist
