

Chapter 7: CAPM

Some questions in this problem set are taken from the book *Investment Science* from Luenberger.

Question 1 (Capital Market Line):

1. (Capital market line) Assume that the expected rate of return on the market portfolio is 23% and the rate of return on T-bills (the risk-free rate) is 7%. The standard deviation of the market is 32%. Assume that the market portfolio is efficient.
- (a) What is the equation of the capital market line?
 - (b) (i) If an expected return of 39% is desired, what is the standard deviation of this position? (ii) If you have \$1,000 to invest, how should you allocate it to achieve the above position?
 - (c) If you invest \$300 in the risk-free asset and \$700 in the market portfolio, how much money should you expect to have at the end of the year?

(a) The capital market line is defined by:

$$\tilde{r}_i = E(r_i) = r_F + \frac{E(r_M) - r_F}{\sigma_M} \sigma_i = 0.07 + \frac{0.23 - 0.07}{0.32} \sigma_i$$

(b) (i)

$$0.39 = 0.07 + \frac{0.23 - 0.07}{0.32} \sigma_i \implies \sigma_i = \frac{0.32^2}{0.23 - 0.07} = 0.64$$

(ii)

$$\omega \times 0.07 + (1 - \omega) \times 0.23 = 0.39 \implies \omega = -1$$

\implies Borrow \$1000 at the risk-free rate and invest \$2000 into the market

(c)

$$300 \times (1.07) + 700 \times (1.23) = 1182$$

Question 2 (A small world):

2. (A small world) Consider a world in which there are only two risky assets, A and B , and a risk-free asset F . The two risky assets are in equal supply in the market; that is, $M = \frac{1}{2}(A + B)$. The following information is known: $r_F = 10$, $\sigma_A^2 = 04$, $\sigma_{AB} = 01$, $\sigma_B^2 = 02$, and $\bar{r}_M = 18$.
- (a) Find a general expression (without substituting values) for σ_M^2 , β_A , and β_B .
 - (b) According to the CAPM, what are the numerical values of \bar{r}_A and \bar{r}_B ?

(a) We use the calculation rules for the covariance of a sum of random variables (<https://en.wikipedia.org/wiki/Covariance>)

Luenberger Chapter 7 Problem:

H-infinity Control and Estimation of State-multiplicative Linear Systems Eli Gershon, Uri Shaked, Isaac Yaesh, 2005-06-24 Multiplicative noise appears in systems where the process or measurement noise levels depend on the system state vector. Such systems are relevant for example in radar measurements where larger ranges involve higher noise level. This monograph embodies a comprehensive survey of the relevant literature with basic problems being formulated and solved by applying various techniques including game theory, linear matrix inequalities and Lyapunov parameter dependent functions. Topics covered include convex H_2 and H_∞ norms, analysis of systems with multiplicative noise, state feedback control and state estimation of systems with multiplicative noise, dynamic and static output feedback of stochastic bilinear systems, tracking controllers for stochastic bilinear systems utilizing preview information. Various examples which demonstrate the applicability of the theory to practical control engineering problems are considered; two such examples are taken from the aerospace and guidance control areas.

Observer Design for Nonlinear Systems Pauline Bernard, 2019-02-01 Observer Design for Nonlinear Systems deals with the design of observers for the large class of nonlinear continuous time models. It contains a unified overview of a broad range of general designs including the most recent results and their proofs such as the homogeneous and nonlinear Luenberger design techniques. The book starts from the observation that most observer designs consist in looking for a reversible change of coordinates transforming the expression of the system dynamics into some specific structures called normal forms for which an observer is known. Therefore the problem of observer design is broken down into three sub problems: What are the available normal forms and their associated observers? Under which conditions can a system be transformed into one of these forms and through which transformation? How can an inverse transformation that recovers an estimate in the given initial coordinates be achieved? This organisation allows the book to structure results within a unified framework highlighting the importance of the choice of the observer coordinates for nonlinear systems. In particular the first part covers state affine forms with their Luenberger or Kalman designs and triangular forms with their homogeneous high gain designs. The second part addresses the transformation into linear forms through linearization by output injection or in the context of a nonlinear Luenberger design and into triangular forms under the well known uniform and differential observability assumptions. Finally the third part presents some recently developed methods for avoiding the numerically challenging inversion of the transformation. Observer Design for Nonlinear Systems addresses students and researchers looking for an introduction to or an overview of the state of the art in observer design for nonlinear continuous time dynamical systems. The book gathers the most important results focusing on a large and diffuse literature on general observer designs with global convergence and is a valuable source of information for academics and practitioners.

Linear and Nonlinear Programming David G. Luenberger, Yinyu Ye, 2021-10-31 The 5th edition of this classic textbook covers the central concepts of practical optimization techniques with

an emphasis on methods that are both state of the art and popular One major insight is the connection between the purely analytical character of an optimization problem and the behavior of algorithms used to solve that problem End of chapter exercises are provided for all chapters The material is organized into three separate parts Part I offers a self contained introduction to linear programming The presentation in this part is fairly conventional covering the main elements of the underlying theory of linear programming many of the most effective numerical algorithms and many of its important special applications Part II which is independent of Part I covers the theory of unconstrained optimization including both derivations of the appropriate optimality conditions and an introduction to basic algorithms This part of the book explores the general properties of algorithms and defines various notions of convergence In turn Part III extends the concepts developed in the second part to constrained optimization problems Except for a few isolated sections this part is also independent of Part I As such Parts II and III can easily be used without reading Part I and in fact the book has been used in this way at many universities New to this edition are popular topics in data science and machine learning such as the Markov Decision Process Farkas lemma convergence speed analysis duality theories and applications various first order methods stochastic gradient method mirror descent method Frank Wolf method ALM ADMM method interior trust region method for non convex optimization distributionally robust optimization online linear programming semidefinite programming for sensor network localization and infeasibility detection for nonlinear optimization

Data Transportation and Protection John E. Hershey, Rao K. Yarlagadda, 2012-12-06 A new breed of engineer is developing in our contemporary society These engineers are concerned with communications and computers economics and regulation These new engineers apply themselves to data to its packaging transmission and protection They are data engineers Formal curricula do not yet exist for their dedicated development Rather they learn most of their tools on the job and their roots are in computer engineering communications engineering and applied mathematics There is a need to draw relevant material together and present it so that those who wish to become data engineers can do so for the betterment of themselves their employer their country and ultimately the world for we share the belief that the most effective tool for world peace and stability is neither politics nor armaments but rather the open and timely exchange of information This book has been written with that goal in mind Today numerous signs encourage us to expect broader information exchange in the years to come The movement toward a true Integrated Services Digital Network ISDN is perhaps the clearest of these Also the development of formal protocol layers reflects both a great deal of brilliance and compromise and also the desire for a common language among data engineers

Introduction to Optimization

Methods P. Adby, 2013-03-09 During the last decade the techniques of non linear optimization have emerged as an important subject for study and research The increasingly widespread application of optimization has been stimulated by the availability of digital computers and the necessity of using them in the investigation of large systems This book is an introduction to non linear methods of optimization and is suitable for undergraduate and post graduate courses in

Parker,1994-06-05 In many physical sciences the most natural description of a system is with a function of position or time In principle infinitely many numbers are needed to specify that function but in practice only finitely many measurements can be made Inverse theory concerns the mathematical techniques that enable researchers to use the available information to build a model of the unknown system or to determine its essential properties In Geophysical Inverse Theory Robert Parker provides a systematic development of inverse theory at the graduate and professional level that emphasizes a rigorous yet practical solution of inverse problems with examples from experimental observations in geomagnetism seismology gravity electromagnetic sounding and interpolation Although illustrated with examples from geophysics this book has broad implications for researchers in applied disciplines from materials science and engineering to astrophysics oceanography and meteorology Parker s approach is to avoid artificial statistical constructs and to emphasize instead the reasonable assumptions researchers must make to reduce the ambiguity that inevitably arises in complex problems The structure of the book follows a natural division in the subject into linear theory in which the measured quantities are linear functionals of the unknown models and nonlinear theory which covers all other systems but is not nearly so well understood The book covers model selection as well as techniques for drawing firm conclusions about the earth independent of any particular model
