**More than Moore** Guo Qi Zhang, Alfred van Roosmalen, 2010-01-23 In the past decades the main stream of microelectronics progress has been mainly powered by Moore's law which focuses on IC miniaturization down to nanoscale While the microelectronics community around the world continues to invent new solutions to keep Moore's law alive there is a fast increasing need for non digital and mixed signal More than Moore MtM type technologies that are still based upon or derived from silicon technologies but do not simply scale with Moore's law Typical examples are devices incorporating RF power high voltage passive components sensors and actuators MEMS Bio chip bio systems microfluidics solid state lighting etc The increasing momentum of MtM is triggered by the increasing needs for high level heterogeneous system integration including non digital functions the necessity to speed up innovative product creation and to broaden the product portfolio of IC fabs and the limiting cost and time factors of advanced system on chip SoC development It is believed that MtM will add value to society on top of and beyond advanced semiconductor technologies with fast increasing marketing potentials and that it will drive paradigm shift for technologies applications and business models

Sansen, Johan Huijsing, 2013-06-29 The realization of signal sampling and quantization at high sample rates with low power dissipation is an important goal in many applications including portable video devices such as camcorders personal communication devices such as wireless LAN transceivers in the read channels of magnetic storage devices using digital data detection and many others This paper describes architecture and circuit approaches for the design of high speed low power pipeline analog to digital converters in CMOS Here the term high speed is taken to imply sampling rates above 1 Mhz In the first section the different conversion techniques applicable in this range of sample rates is discussed Following that the particular problems associated with power minimization in video rate pipeline ADCs is discussed These include optimization of capacitor sizes design of low voltage transmission gates and optimization of switched capacitor gain blocks and operational amplifiers for minimum power dissipation As an example of the application of these techniques the design of a power optimized 10 bit pipeline A/D

converter ADC that achieves 167 mW per MS/s of sampling rate from 1 MS/s to 20 MS/s is described 2 Techniques for CMOS Video Rate A/D Conversion Analog to digital conversion techniques can be categorized in many ways One convenient means of comparing techniques is to examine the number of analog clock cycles required to produce one effective output sample of the signal being quantized
