AWS Certified Solutions Architect – Associate (SAA-C03) Sample Exam Questions

Answers

- 1) A – An Application Load Balancer (ALB) sends requests to healthy instances only. An ALB performs periodic [health checks](#) on targets in a target group. An instance that fails health checks for a configurable number of consecutive times is considered unhealthy. The load balancer will no longer send requests to the instance until it passes another health check.
- 2) D – When the `ReceiveMessageWaitTimeSeconds` property of a queue is set to a value greater than zero, [long polling](#) is in effect. Long polling returns the number of empty responses by allowing Amazon SQS to wait until a message is available before sending a response to a `ReceiveMessage` request.
- 3) B – An [AWS Storage Gateway volume gateway](#) connects an on-premises software application with cloud-backed storage volumes that can be mounted as iSCSI or Network File System (NFS) devices from on-premises application servers. In cached volume mode, all the data is stored in Amazon S3 and a copy of frequently accessed data is stored locally.
- 4) A, B – A [VPC gateway](#) forwards traffic from the instances in the private subnet to the internet or other AWS services, and then sends the response back to the instances. After a VPC gateway is created, the route table for private subnets must be updated to point internet traffic to the VPC gateway.
- 5) C – [EBS snapshots](#) are an instance saves the contents of EBS to the Amazon EBS root volume. When the instance restarts, the EBS contents are restored.
- 6) C – A [secondary ENI](#) can be added to an instance. While primary ENIs cannot be detached from an instance, secondary ENIs can be detached and attached to a different instance.
- 7) A – Web browsers will block the execution of a script that originates from a server with a different domain name than the webpage. [Amazon S3 can be configured with CORS](#) to send HTTP headers that allow the script execution.
- 8) C, B – Server Side Encryption with Customer-Provided Keys (SSE-C) enables Amazon S3 to encrypt objects server side using an encryption key provided in the PUT request. The same key must be provided in GET requests for Amazon S3 to decrypt the object. Customers also have the option to encrypt data client side before uploading it to Amazon S3 and decrypting it after downloading it. AWS S3s provide an S3 encryption client that streamlines the process.
- 9) A – Data can be stored directly in [Amazon S3 Glacier Deep Archive](#). This is the cheapest S3 storage class.
- 10) A – While [Sustained Requests](#) would be the least costly option, they are not suitable for jobs that cannot be interrupted or must complete within a certain time period. [On-Demand Instances](#) would be ideal for the number of requests they are running.
