Neil,Nancy A. Speck,Andre van Wijnen,2017-03-15 This volume provides the reader with an overview of the diverse functions of the RUNX family of genes As highlighted in the introduction and several of the 29 chapters humans and other mammals have three RUNX genes that are known to play specific roles in

blood bone and neuronal development However their evolutionary history has recently been traced back to unicellular organisms and their involvement in many well known signaling pathways Wnt TGF $\beta$  Notch Hippo is indicative of a more general function in cell biology Their documented roles in cell fate decisions include control of proliferation differentiation survival senescence and autophagy The pleiotropic effects of RUNX in development are mirrored in cancer where RUNX genes can function as oncogenes that collaborate strongly with Myc family oncogenes or as tumour suppressor genes In the latter role they display hallmarks of both gatekeepers that modulate p53 responses and caretakers that protect the genome from DNA damage Several chapters focus on the importance of these genes in leukemia research where RUNX1 and CBF $\beta$  are frequently affected by chromosomal translocations that generate fusion oncoproteins while recent studies suggest wider roles for RUNX modulation in solid cancers Moreover RUNX genes are intimately involved in the development and regulation of the immune system while emerging evidence suggests a role in innate immunity to infectious agents including HIV At the biochemical level the RUNX family can serve as activators or repressors of transcription and as stable mediators of epigenetic memory through mitosis Not surprisingly RUNX activity is controlled at multiple levels this includes miRNAs and a plethora of post translational modifications Several chapters highlight the interplay between the three mammalian RUNX genes where cross talk and partial functional redundancies are evident Finally structural analysis of the RUNX CBF $\beta$  interaction has led to the development of small molecule inhibitors that provide exciting new tools to decipher the roles of RUNX in development and as targets for therapy This volume provides a compendium and reference source that will be of broad interest to cancer researchers developmental biologists and immunologists *Stem Cells* Khawaja H.

This book explores the role of endothelial progenitor cells EPCs in the context of regenerative medicine RegMed In particular it reveals the value of RegMed as a new TM branch intended to improve the health and quality of life by restoring maintaining or enhancing tissue and functions of organs The book is divided into three chapters the first of which describes

the relevance of translational medicine TM as a new research approach to counteract the imposing challenge of age related diseases Of the diverse RegMed approaches particular attention is paid to stem progenitor cell based therapies their benefits and shortcomings as well as to the description of types of stem and progenitor cells considered for regenerative cell therapies such as EPCs as emerging candidates for RegMed applications In turn the second chapter outlines the clinical relevance of EPCs as both potential predictors diagnostic and prognostic biomarkers of age related diseases and therapeutic agents discussing their advantages disadvantages and conflicting data Chapter three proposes a potential roadmap for revising the findings and creating a clearer picture of valid data which can provide support for various important aspects i e isolating and characterizing EPCs by establishing standardized criteria for EPC research identifying appropriate sub populations for cell therapy timing dosing priming of cells and defining delivery modes for different applications The book concludes with an overview of innovative strategies that could improve the efficacy of cell therapy at all levels including cell priming bio nanotechnology and tissue engineering
