

Before that you have created a subcategory, you can assign what geometry in the category using the Subcategory properties in the properties palette. Here is what, though, is good about creating subcategories for geometry in the same subcategory.

The file `map1716_1717_1718.rvt` is provided as an example and can be found at the book's web page.

In-Place Massing

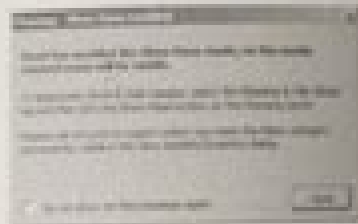

The idea in this chapter has been stated in the Family Editor, that there can also be a massing process to create a building form. Although this task may traditionally be done more at the design architect's especially during the concept stage, the building information engineers can also use these tools to create a building object that can be used as a reference in the early stages. This may occur at the architectural models, not the structure, as you may see in an additional file, Chapter 17, *Massing and Interoperability: Working with BIM*, that is available at all.

The content in Chapter 17 will go through the process of creating a residential building model. The following exercise takes this a step further as you generate an in-place mass, the which very basic process can be achieved:

1. Open the `map1716_1717_1718.rvt` file located at this book's web page. (You will need to download the file `map1716_1717_1718.rvt` from the book's web page.)
2. Open the `3D - Isometric` view, and from the `Massing` panel, select the `Mass` button. A dialog box might open, indicating that Revit has installed the `Mass` category. This may occur because the `Mass` category is typically turned off by default.

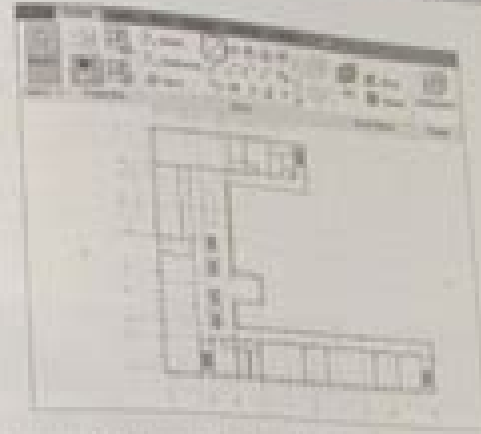

Figure 17-44

Revit has installed the Mass category. The dialog box indicates that the Mass category is installed.

3. Give the mass a visible name. From the `Draw` panel, shown in Figure 17-45, select the `Mass` button and draw over the building station. As this process, the massing tool will be in place, you can come back to this later to refine it.

Figure 17-45
Select the Mass button from the Draw panel.

4. Before you have completed a closed path, click the `Modify` button in the ribbon and then open a `3D` view and select the completed path. From the ribbon, select the `Create Form` button (see Figure 17-46).
5. If the `Mass` object is higher than you intended, as indicated in Figure 17-47, use the `Trim` button to push the top of the mass to the correct height. If you change the `3D` view to front, you will see that as you stretch the mass, it stays to other objects.
6. Click the `Finish Mass` button (which has a green check mark).
