aimed at the design and operation of modern particle accelerators. It is intended as a vade mecum for professional engineers and physicists engaged in these subjects. With a collection of more than 2000 equations, 300 illustrations and 500 graphs and tables, here one will find in addition to common formulae of previous compilations, hard to find specialized formulae, recipes and material data pooled from the lifetime experience of many of the world's most able practitioners of the art and science of accelerators. The seven chapters include both theoretical and practical matters as well as an extensive glossary of accelerator types. Chapters on beam dynamics and electromagnetic and nuclear interactions deal with linear and nonlinear single particle and collective effects including spin motion, beam environment, beam-beam, electron beam-ion and intrabeam interactions. The impedance concept and related calculations are dealt with at length as are the instabilities due to the various interactions mentioned. A chapter on operational considerations including discussions on the assessment and correction of orbit and optics errors, real-time feedbacks, generation of short photon pulses, bunch compression, phase space exchange, tuning of normal and superconducting linacs, energy recovery linacs, free electron lasers, cryogenic vacuum systems, steady state microbunching, cooling, space charge compensation, brightness of light sources, collider luminosity optimization and collision schemes, machine learning, multiple frequency rf systems, FEL seeding, ultrafast electron diffraction and Gamma Factory. Chapters on mechanical and electrical considerations present material data and important aspects of component design including heat transfer and refrigeration. Hardware systems for particle sources, feedback systems, confinement including undulators and acceleration, both normal and superconducting, receive detailed treatment in a sub-systems chapter, beam measurement and apparatus being treated therein as well. A detailed name and subject index is provided together with reliable references to the literature where the most detailed information available on all subjects treated can be found.

**Electrostatic Effects in Soft Matter and Biophysics** Christian Holm, Patrick Kélicheff, Rudolf Podgornik, 2012-12-06  
Soft Condensed Matter commonly deals with materials that are mechanically soft and more importantly particularly prone to thermal fluctuation effects. Charged soft matter systems are especially interesting; they can be manufactured artificially as polyelectrolytes to serve as superabsorbers in dypers as flocculation and retention agents as thickeners and gelling agents and as oil recovery process aids. They are also abundant in living organisms, mostly performing important structural e.g. membranes and functional e.g. DNA tasks. The book describes the many areas in soft matter and biophysics where electrostatic interactions play an important role. It offers in depth coverage of recent theoretical approaches, advances in computer simulation and novel experimental techniques. Readership: Advanced undergraduate level in physics, physical chemistry and theoretical biochemistry.
