

The retina contains cones and rods, light receptors. Conserve clear vision, bright color. Activated in light. Stops functioning in almost complete darkness.

Rods: Less clear vision, grey, white color. Also senses movement in the visual field and continues to function in very dim light, almost complete darkness. The macula contains many cones, and a few rods.

The fovea contains a high concentration of cones and no rods. The peripheral field of the retina contains many rods and some cones with less and no cones into the far outer peripheral. This is why the center of the visual field is clearest. See clear by using the Macula, Fovea Centralis, center of the visual field. See much clearer, fine details, brightest color by using the fovea, exact center of the retina, visual field.

The center of the visual field moves with the eyes from object to object, part to part on objects keeping the vision clear.

•The Fovea centralis, center of the retina produces the exact center of the visual field, clearest vision, bright color.
•The Peripheral field of the retina produces the peripheral field of vision. Less clear vision, less color.
