

Chapter 10 Nuclear Chemistry

Section 10.4 Fission and Fusion**(pages 308–315)**

This section discusses nuclear forces and the conversion of mass into energy. It also describes the nuclear processes of fission and fusion.

Reading Strategy (page 308)

Comparing and Contrasting As you read, contrast fission and fusion in the Venn diagram below by listing the ways they differ. For more information on this Reading Strategy, see the **Reading and Study Skills** in the **Skills and Reference Handbook** at the end of your textbook.

**Nuclear Forces (pages 308–309)**

1. Describe the strong nuclear force. The strong nuclear force is the attractive force that binds protons and neutrons together in the nucleus.
2. Is the following sentence true or false? Over very short distances, the strong nuclear force is much greater than the electric forces among protons. true
3. Electric forces in atomic nuclei depend on the number of protons.
4. Is the following sentence true or false? The strong nuclear force on a proton or neutron is much greater in a large nucleus than in a small nucleus. false
5. All nuclei with 83 or more protons are radioactive.

Fission (pages 309–313)

6. Describe fission. Fission is the splitting of an atomic nucleus into two smaller parts.
7. Fission can produce very large amounts of energy from very small amounts of mass.

Cold Nuclear Fusion Florian Ion Petrescu, 2012-07-01 Nuclear fusion is the process by which two or more atomic nuclei join together or fuse to form a single heavier nucleus During this process matter is not conserved because some of the mass of the fusing nuclei is converted to energy which is released The binding energy of the resulting nucleus is greater than the binding energy of each of the nuclei that fused to produce it Fusion is the process that powers active stars Creating the required conditions for fusion on Earth is very difficult to the point that it has not been accomplished at any scale for protium the common light isotope of hydrogen that undergoes natural fusion in stars In nuclear weapons some of the energy released by an atomic bomb fission bomb is used for compressing and heating a fusion fuel containing heavier isotopes of hydrogen and also sometimes lithium to the point of ignition At this point the energy released in the fusion reactions is enough to briefly maintain the reaction Fusion based nuclear power experiments attempt to create similar conditions using far lesser means although to date these experiments have failed to maintain conditions needed for ignition long enough for fusion to be a viable commercial power source There are many experiments examining the possibility of fusion power for electrical generation Nuclear fusion has great potential as a sustainable energy source This is due to the abundance of hydrogen on the planet and the inert nature of helium the nucleus which would result from the nuclear fusion of hydrogen atoms Unfortunately a controlled nuclear fusion reaction has not yet been achieved due to the temperatures required to sustain one In hot fusion it need a temperature of 4000 million degrees Without a minimum of 3000 million degrees we can t make the hot fusion reaction to obtain the nuclear power Today we have just 150 million degrees made To replace the lack of necessary temperature it uses various tricks Because obtaining the necessary huge temperature for hot fusion is still difficult it is time to focus us on cold nuclear fusion We need to bomb the fuel with accelerated deuterium nuclei The fuel will be made from heavy water and lithium The optimal proportion of lithium will be tested It would be preferable to keep fuel in the plasma state Research into developing controlled thermonuclear fusion for civil purposes also began in earnest in the 1950s and it continues to this day Two projects the National Ignition Facility and ITER are in the process of reaching breakeven after 60 years of design improvements developed from previous experiments The best results were obtained with the Tokamak type installations

Nuclear Fusion and Fission Fiona Young-Brown, 2016-07-15 Nuclear Fusion and Fission delves into nuclear physics and the scientists responsible for the discovery of splitting and fusing an atom The book begins with the very basic building blocks of science breaking down the

different types of energy and how we use them the materials that make up an atom and our search for the perfect renewable energy source Set against the cultural backdrop of World War II later chapters follow each significant theory that led to the creation of the world's most dangerous weapon as well as some of its most widely used medical and food production processes today [Government Reports Announcements & Index](#) ,1987-05 **Subbarrier Fusion of Atomic Nuclei** M. Beckerman,1985 *Subbarrier Fusion of Atomic Nuclei* M. Beckerman,1985 **The Curve of Binding Energy** Paul F. Kisak,2016-05-31 Nuclear binding energy is the energy that would be required to disassemble the nucleus of an atom into its component parts These component parts are neutrons and protons which are collectively called nucleons The binding energy of nuclei is due to the attractive forces that hold these nucleons together and this is usually a positive number since most nuclei would require the expenditure of energy to separate them into individual protons and neutrons The mass of an atomic nucleus is usually less than the sum of the individual masses of the constituent protons and neutrons according to Einstein's equation $E = mc^2$ and this missing mass is known as the mass defect and represents the energy that was released when the nucleus was formed The term nuclear binding energy may also refer to the energy balance in processes in which the nucleus splits into fragments composed of more than one nucleon If new binding energy is available when light nuclei fuse or when heavy nuclei split either process can result in release of this binding energy This energy may be made available as nuclear energy and can be used to produce electricity as in nuclear power or in a nuclear weapon When a large nucleus splits into pieces excess energy is emitted as photons gamma rays and as the kinetic energy of a number of different ejected particles nuclear fission products The nuclear binding energies and forces are on the order of a million times greater than the electron binding energies of light atoms like hydrogen The mass defect of a nucleus represents the mass of the energy of binding of the nucleus and is the difference between the mass of a nucleus and the sum of the masses of the nucleons of which it is composed **Splitting the Atom** Alan Morton,2005 This fabulous new series takes key scientific developments from the last century and investigates how they came about their creation or discovery and their long term effects Each book places the development in the context of its time to increase awareness of some of the amazing discoveries that have helped to shape the world today and the key people behind each of these scientific milestones Splitting the Atom investigates the theories and practical developments that led to the turning point in nuclear science the realisation that splitting the nucleus of an atom created energy that could be harnessed for good and for ill *Nuclear Fission* Robert Vandenbosch,2012-12-02 Nuclear Fission provides a comprehensive account of nuclear fission This book is organized into 14 chapters Chapter I introduces and discusses the discovery of fission followed by a treatment of transition nucleus in Chapters II to VIII Chapter IX deals with the theories of mass and energy distributions The kinetic energy release in fission is described in Chapter X while the distribution of mass and charge in fission is considered in Chapter XI Chapters XII and XIII consider the emission of neutrons and rays from fission Detailed studies of the particles accompanying fission are covered in the last chapter This

volume is intended for students but is also valuable to research scientists interested in the physics and chemistry of fission
