

Use the above class as a superclass to implement the following 3 subclasses:

<u>Class</u>	<u>Instance Fields</u>
IDCard	ID number
CallingCard	Card number, PIN
DriverLicense	Expiration year

- Write declarations for each of the subclasses. For each subclass, supply private instance variables. Leave the bodies of the constructors and the format methods blank for now.
- Code constructors for each of the three subclasses. Each constructor should call the superclass constructor to set the name. Here is one example:

```
public IDCard(String n, String id)
{
    super(n);
    idNumber = id;
}
```

- Replace the code of the format method for the three subclasses. The methods should produce a formatted description of the card details. The subclass methods should call the superclass format method to get the formatted name of the cardholder then add the additional formatted instance fields. Here is an example for IDCard:

Based in part on a survey of ethical decision making among 682 medical geneticists worldwide this book includes a chapter authored by a geneticist and an ethicist in 19 nations describing genetic services counselling screening prenatal diagnosis and major ethical problems and social controversies faced by geneticists The concluding chapter describes ethical and policy issues that exist worldwide and offers some possible resolutions

**The Practices of Human Genetics** Michael Fortun, E. Mendelsohn, 1998-12-31 That concern about human genetics is at the top of many lists of issues requiring intense discussion from scientific political social and ethical points of view is today no surprise It was in the spirit of attempting to establish the basis for intelligent discussion of the issues involved that a group of us gathered at a meeting of the International Society for the History Philosophy and Social Studies of Biology in the Summer of 1995 at Brandeis University and began an exploration of these questions in earlier versions of the papers presented here Our aim was to cross disciplines and jump national boundaries to be catholic in the methods and approaches taken and to bring before readers interested in the emerging issues of human genetics well reasoned informative and provocative papers The initial conference and elements of the editorial work which have followed were generously supported by the Stifterverband für die Deutsche Wissenschaft We thank Professor Peter Weingart of Bielefeld University for his assistance in gaining this support As Editors we thank the anonymous readers who commented upon and critiqued many of the papers and in turn made each paper a more valuable contribution We also thank the authors for their understanding and patience Michael Fortnn Everett Mendelsohn Cambridge MA September 1998 vii

Porter, 2018-06-05 The untold story of how hereditary data in mental hospitals gave rise to the science of human heredity In the early 1800s a century before there was any concept of the gene physicians in insane asylums began to record causes of madness in their admission books Almost from the beginning they pointed to heredity as the most important of these causes As doctors and state officials steadily lost faith in the capacity of asylum care to stem the terrible increase of insanity they began emphasizing the need to curb the reproduction of the insane They became obsessed with identifying weak or tainted families and anticipating the outcomes of their marriages Genetics in the Madhouse is the untold story of how the collection and sorting of hereditary data in mental hospitals schools for feeble minded children and prisons gave rise to a new science of human heredity In this compelling book Theodore Porter draws on untapped archival evidence from across Europe and North America to bring to light the hidden history behind modern genetics He looks at the institutional use of pedigree charts censuses of mental illness medical social surveys and other data techniques innovative quantitative

practices that were worked out in the madhouse long before the manipulation of DNA became possible in the lab Porter argues that asylum doctors developed many of the ideologies and methods of what would come to be known as eugenics and deepens our appreciation of the moral issues at stake in data work conducted on the border of subjectivity and science A bold rethinking of asylum work Genetics in the Madhouse shows how heredity was a human science as well as a medical and biological one *Departments of Labor, Health and Human Services, Education, and Related Agencies Appropriations for Fiscal Year 1988: Department of Education, Department of Health and Human Services* United States. **Laboratory Manual Inquiry into Life** Sylvia S. Mader, **Cumulated Index Medicus**, 1971 **Biological Communities Respond to Multiple Human-Induced Aquatic Environment Change** Marina Manca, Roberta Piscia, 2020-05-28 Perturbations linked to the direct and indirect impacts of human activities during the Anthropocene affect the structure and functioning of aquatic ecosystems to varying degrees Some perturbations involve stress to aquatic life including soil and water acidification soil erosion loss of base cations release of trace metals organic compounds and application of essential nutrients capable of

stimulating primary productivity Superimposed onto these changes climate warming impacts aquatic environments via altering species metabolic processes and by modifying food web interactions The interaction stressors is difficult to predict because of the differential response of species and taxonomic groups interacting additively synergistically or antagonistically Whenever different trophic levels respond differently to climate warming food webs are restructured yet the consequences of warming induced changes for the food web structure and long term population dynamics of different trophic levels remain poorly understood Such changes are crucial in lakes where food web production is mainly due to ectotherms which are highly sensitive to changes in their surrounding environment Due to its remarkable physical inertia including thermal stability global warming also has a profound effect on groundwater ecosystems Combining contemporary and palaeo data is essential to understand the degree to which mechanisms of stressors impact on lake biological communities and lake ecosystem functioning The degree to which alterations can affect aquatic ecosystem structure and functioning also requires functional diversity to be addressed at the molecular level to reconstruct the role different species play in the transfer of material and energy through the food web In this issue we present examples of the impact of different stressors and their interaction on aquatic ecosystems providing long term metabolic molecular and paleolimnological analyses
