

# A Human Pedigree

## Introduction

A sex-linked characteristic is determined by an allele that is carried only on the X chromosome. The shorter Y chromosome does not carry an allele for a sex-linked trait. Most sex-linked traits are recessive. Since there is only one X chromosome in the male, a male who carries a particular recessive allele on the X chromosome will have the sex-linked condition. A female who carries a recessive allele in one X chromosome will not have the condition if there is a dominant allele on her other X chromosome. She will express the recessive condition only if she inherits two recessive alleles - from each parent. Her chances of inheriting a sex-linked condition are thus significantly less than those of a male.

## Procedure

Study the pedigree for hemophilia shown in Figure 1 below.

Figure 1: Pedigree of heredity

1. In a pedigree, a square represents a male. If it is darkened, he has hemophilia; if clear, he has normal blood clotting.

*How many males represented by this pedigree have hemophilia?  
How many males are normal?*

2. A circle represents a female. If it is darkened, she has hemophilia; if clear, she is normal.

*How many females in this pedigree have hemophilia? How many are normal?*
