*Recent Research On Domination Related Parameters* Dr. D. D. Pandya, 2021-09-05 In this thesis we have discussed variants of domination like vertex covering Independent domination  $K$  domination  $K$  dependent set  $K$  dependent  $K$  domination Total domination Extended total domination  $K$  tuple domination Total  $K$  domination Restrained domination and Total restrained domination We have characterized edges whose removal affects or does not affect these variants We have also discussed changing and unchanging of these variants in terms of edge addition between two non adjacent vertices From history we can see that much work has been done for critical graphs but existing work is related to all edges of graph But for application point of view sometimes we require to delete or add any particular edge So our work is related to any particular edge but it is applicable for all graphs When existing work for critical graphs is applicable for any edge but in some particular graph In this way our results carry more important when any particular edge is to be focused We have also discussed bondage number for some variants Our results are related to relation between vertices and edges whose removal affects all these variants Many research papers have been published for criticalness of graph with respect to vertex removal So our results may be link between vertices and edge removal It will insist many research scholars to do work in this direction We believe our study will become instrumental in making the relation between edge removal and vertex removal more transparent and effectively We hope our thesis provide row material for other research scholars of engineering field also

Graph and Network Theory Michael A. Henning, Jan H. van Vuuren, 2022-06-03 This textbook covers a diversity of topics in graph and network theory both from a theoretical standpoint and from an applied modelling point of view Mathematica is used to demonstrate much of the modelling aspects Graph theory and model building tools are developed in tandem with effective techniques for solving practical problems via computer implementation The book is designed with three primary readerships in mind Individual syllabi or suggested sequences for study are provided for each of three student audiences mathematics applied mathematics operations research and computer science In addition to the visual appeal of each page the text contains an abundance of gems Most chapters open with real life problem descriptions which serve as motivation for the theoretical development of the subject matter Each chapter concludes with three different sets of exercises The first set of exercises are standard and geared toward the more mathematically inclined reader Many of these are routine exercises designed to test understanding of the material in the text but some are more challenging The second set of exercises is earmarked for the computer technologically savvy reader and offer computer exercises using Mathematica The final set consists of larger projects aimed at equipping those readers with backgrounds in the applied sciences to apply the necessary skills learned in the chapter in the context of real world problem solving Additionally each chapter offers biographical notes as well as pictures of graph theorists and mathematicians who have contributed significantly to the development of the results documented in the chapter These notes are meant to bring the topics covered to life allowing the

reader to associate faces with some of the important discoveries and results presented In total approximately 100 biographical notes are presented throughout the book The material in this book has been organized into three distinct parts each with a different focus The first part is devoted to topics in network optimization with a focus on basic notions in algorithmic complexity and the computation of optimal paths shortest spanning trees maximum flows and minimum cost flows in networks as well as the solution of network location problems The second part is devoted to a variety of classical problems in graph theory including problems related to matchings edge and vertex traversal connectivity planarity edge and vertex coloring and orientations of graphs Finally the focus in the third part is on modern areas of study in graph theory covering graph domination Ramsey theory extremal graph theory graph enumeration and application of the probabilistic method
