

Elements & Macromolecules in Organisms

Most common elements in living things are **carbon, hydrogen, nitrogen, and oxygen**. These four elements constitute about **95% of your body weight**. All compounds can be classified in two broad categories --- **organic and inorganic compounds**. Organic compounds are made primarily of **carbon**. Carbon has **four outer electrons** and can form four bonds. Carbon can form **single, double, or triple bonds**. Organic compounds also contain **hydrogen**. Since hydrogen has only one electron, it can form only **single bonds**.

Each small organic molecule can be a unit of a large organic molecule called a macromolecule. There are four classes of macromolecules – carbohydrates, lipids, proteins, and nucleic acids. Carbohydrates and lipids are made of only carbon, hydrogen, and oxygen. Proteins are made of carbon, hydrogen, oxygen, and nitrogen. Nucleic acids, such as DNA and RNA, contain carbon, hydrogen, oxygen, nitrogen, and phosphorus.

Using the drawing of the amino acid below page 3, determine the number of bonds formed by oxygen, hydrogen, and nitrogen (each line indicates a bond).

_____ Oxygen

_____ Hydrogen

_____ Nitrogen

The four main classes of organic compounds (**carbohydrates, lipids, proteins, and nucleic acids**) that are essential to the proper functioning of all living things are known as polymers or macromolecules. All of these compounds are built primarily of carbon, hydrogen, and oxygen but in different ratios. This gives each compound different properties.

The body also needs trace amounts of other elements such as calcium, potassium, and sulfur for proper functioning of muscles, nerves, etc. **Color** each of the **elements** according to the color listed next to the element's symbol. Then **Color code** the squirrel with the correct proportion of each element's color. Now **color code** the carrot with the same colors as you used on the squirrel.

Physical Biology of the Cell Rob Phillips, Jane Kondev, Julie Theriot, Hernan Garcia, 2012-10-29 *Physical Biology of the Cell* is a textbook for a first course in physical biology or biophysics for undergraduate or graduate students. It maps the huge and complex landscape of cell and molecular biology from the distinct perspective of physical biology. As a key organizing principle, the proximity of topics is based on the physical concepts that *Around the World in 18 Elements* David Scott, 2015-11-06. Written with both students and educators in mind, this book presents a tour of the elements found in the British A level syllabus. Each chapter presents a key concept of chemistry in the context of the element, instilling a wider background in chemistry to the reader which can then be tested by questions in the text. Students of chemistry will enjoy this informative approach to revision while educators will gain inspiration for planning lessons and discussing concepts. International baccalaureate and foundation year students will also benefit from the topics presented in this accessible textbook. Find out more including resources at <http://www.rsc.org/learn/chemistry/resource/res00001996> *Around the World in 18 Elements* book *Elements of Molecular Neurobiology* C. U. M. Smith, 2003-06-13. This edition of the popular text incorporates recent advances in neurobiology enabled by modern molecular biology techniques. Understanding how the brain works from a molecular level allows research to better understand behaviours, cognition and neuropathologies. Since the appearance six years ago of the second edition, much more has been learned about the molecular biology of development and its relations with early evolution. This evodevo as it has come to be known framework also has a great deal of bearing on our understanding of neuropathologies as dysfunction of early onset genes can cause neurodegeneration in later life. Advances in our understanding of the genomes and proteomes of a number of organisms also greatly influence our understanding of neurobiology. Well known and widely used as a text throughout the UK, good reviews from students and lecturers. Good complement to *Fundamentals of Psychopharmacology* by Brian Leonard. This book will be of particular interest to biomedical undergraduates undertaking a neuroscience unit, neuroscience postgraduates, physiologists, pharmacologists. It is also a useful basic reference for university libraries. Maurice Elphick, Queen Mary University of London. I do like this book and it is the recommended textbook for my course in Molecular Neuroscience. The major strength of the book is the overall simplicity of the format, both in terms of layout and diagrams. *Everybody's Story* Loyal Rue, 2000-01-01. This exhilarating tale of natural history illuminates the evolution of matter, life and consciousness. In *Everybody's Story*, Loyal Rue finds the means for global solidarity and cooperation in the shared story of humanity. **The Handy Biology Answer Book** Patricia Barnes-Svarney, Thomas E. Svarney, 2014-07-21. Easy to use and friendly guide explains the inner workings of cells, bacteria, viruses, fungi, plants, animals, as well as evolution, the environment, DNA and chromosomes, genetics and genetic engineering, laboratory techniques and much, much more. Gene therapy, Forensic DNA profiling, Biochemistry, Biotechnology, Cloning, Stem Cells, Super Bugs, Genetically modified food, Botany, Zoology, Sex.
