

Applications of Area, Length and Distance

1. A sector of a circle is a region of the circle bounded by a central angle and the corresponding arc.

As proportional relationships exist between the central angle bounding the sector and the complete circle, these have previously determined a relation that could be written provided that arc length, s , is circular arc length, θ (given a central angle) values or distances of rotation. This function gives the arc length s as a function of radius, r , in general form:

$$\text{Arc Length} = \frac{\theta}{360} (\text{circumference of circle})$$

Another way to find arc length is to think about unit π , which is circumference. As you collected that the arc length in this previous activity, you determined that arc length is directly a function of the circle's circumference, which has been expressed in terms of π . This relationship may be summarized proportionally as circle of any given radius, r , is written:

$$\frac{\text{Arc Length}}{2\pi r} = \frac{\text{Degrees of Rotation}}{360}$$

Similarly, you determined a function that could be written provided the arc length s is a central angle in an angle of measure θ degrees of radius r :

$$(\text{Arc Length for length of Rotation}) = \frac{\theta}{360} (\text{circumference of circle})$$

As you collected that for your radius, the previous activity, you determined that, the arc length, area of a sector (or area swept) is proportional to the circle's circumference may be expressed in terms of π . This relationship is summarized proportionally for a circle of any given radius, r , is written:

$$\frac{\text{Area of Sector}}{\pi r^2} = \frac{\text{Degrees of Rotation}}{360}$$

Example: (Based on previous activity and necessary.)

1. If the radius of a circle is 10 units and the angle is 60 degrees, find the arc length and area of the sector.
