Beamwidth vs Frequency — HT94
Whole Space (Anechoic)

DIRECTIVITY

The axial directivity factor R_0 (formerly Q_0) of the HT94 horn was computed at each one-third octave center frequency from the horizontal/vertical polars which are displayed on the left. The graph in Figure 2 illustrates this data over the range 1-5 kHz to 16 kHz. The axial frequency response of the HT94 horn with a particular driver is in close correspondence to that driver's power response above 1 kHz.

BEAMWIDTH

A plot of the HT94's 6-dB-down total included beamwidth angle is shown in Figure 3 for each one-third octave center frequency. The horizontal beamwidth is maintained at 90° (+10° -15°) over the range 3 kHz to 16 kHz. Vertical beamwidth control occurs only above 3 kHz because of the relatively short vertical dimension of the horn's mouth.

POLAR RESPONSE

The directional characteristics of the HT94 with driver attached were measured by running a set of horizontal/vertical polar responses, in EV's large anechoic chamber, at each one-third octave center frequency. The test signal was one-third octave bandwidth limited pseudo-random pink noise (1.0 Hz repetition rate) centered at the indicated frequencies. The measurement microphone was placed 6-1 m (20 ft.) from the horn mouth, while rotation was about the horn rear driver flange. The horn was suspended freely with no baffle. The polars shown in Figure 8 display the results of these tests. The center frequency and beamwidth angle are noted on each polar. The top angle at the center on each chart is the horizontal beamwidth (—) and the bottom angle is the vertical beamwidth (---).
