PSpice for Circuit Theory and Electronic Devices is one of a series of five PSpice books and introduces the latest Cadence
Orcad PSpice version 10.5 by simulating a range of DC and AC exercises. It is aimed primarily at those wishing to get up to
speed with this version but will be of use to high school students, undergraduate students and of course lecturers. Circuit
theorems are applied to a range of circuits and the calculations by hand after analysis are then compared to the simulated
results. The Laplace transform and the s plane are used to analyze CR and LR circuits where transient signals are involved.
Here the Probe output graphs demonstrate what a great learning tool PSpice is by providing the reader with a visual
verification of any theoretical calculations. Series and parallel tuned resonant circuits are investigated where the difficult
concepts of dynamic impedance and selectivity are best understood by sweeping different circuit parameters through a range
of values. Obtaining semiconductor device characteristics as a laboratory exercise has fallen out of favour of late but
nevertheless is still a useful exercise for understanding or modelling semiconductor devices. Inverting and non-inverting
operational amplifiers characteristics such as gain bandwidth are investigated and we will see the dependency of bandwidth
on the gain using the performance analysis facility. Power amplifiers are examined where PSpice Probe demonstrates very
nicely the problems of cross over distortion and other problems associated with power transistors. We examine power
supplies and the problems of regulation, ground bounce and power factor correction. Lastly we look at MOSFET device
characteristics and show how these devices are used to form basic CMOS logic gates such as NAND and NOR gates.

Bell, 2009-11-22 The laboratory investigations in this manual are designed to demonstrate the theoretical principles set out in the book *Fundamentals of Electronic Devices and Circuits* 5^e. A total of 43 laboratory investigations are offered involving the construction and testing of the circuits discussed in the textbook. Each investigation can normally be completed within a two-hour period. The procedures contain some references to the textbook; however, all necessary circuit and connection diagrams are provided in the manual so that investigations can also be performed without the textbook.
