

**Q#1. What is concurrency control?**

Ans:

Concurrency control (CC) is a process to ensure that data is updated correctly and appropriately when multiple transactions are concurrently executed in DBMS. Concurrency control protocols can be broadly divided into two categories –

- ☐ Lock based protocols
- ☐ Time stamp based protocols

Locks are of two kinds –

- ☐ Binary Locks
- ☐ Shared/exclusive

Q#2. Shortly explain Referential integrity constraints.

Ans:

For **referential integrity** to hold in a relational database, any column in a base table that is declared a foreign key can contain either a null value, or only values from a parent table's primary key or a candidate key.

Q#3. What is anomaly in database?

Ans:

1. An insertion **anomaly** is the inability to add data to the **database** due to absence of other data. For example, assume Student_Group is defined so that null values are not allowed. Update, deletion, and insertion **anomalies** are very undesirable in any database. **Anomalies** are avoided by the process of normalization.

2. These problems arise from relations that are generated directly from user views are called **anomalies**. There are three types of **anomalies**: update, deletion and insertion **anomalies**. An update **anomaly** is a data inconsistency that results from data redundancy and a partial update.

3. Without normalization many problems can occur when trying to load an integrated conceptual model into the DBMS.

Q#4. What is meant by transitive dependency?

Ans: In Database Management System, a **transitive dependency** is a functional dependency which holds by virtue of transitivity. A transitive dependency can occur only in a relation that has three or more attributes. Let A, B, and C designate three distinct attributes (or distinct collections of attributes) in the relation. Suppose all three of the following conditions hold:

1. $A \rightarrow B$
2. It is not the case that $B \rightarrow A$
3. $B \rightarrow C$

Then the functional dependency $A \rightarrow C$ (which follows from 1 and 3 by the axiom of transitivity) is a transitive dependency.

Q#5. What is three tier architecture?

Ans: A three-tier architecture is a **client-server architecture** in which the functional process logic, data access, computer data storage and user interface are developed and maintained as independent modules on separate platforms.
