## Lambda Expressions

Lambda expressions are a concise way to represent anonymous functions in Java.

They provide a shorthand notation for writing code by allowing the creation of small, inline implementations of functional interfaces.

Lambda expressions consist of parameters, an arrow token ( $\rightarrow$ ), and a body.

```
// Ensures the interface can have just one method  
@FunctionalInterface  
interface SumFunction {  
int sum(int a, int b);  
}  
  
public class LambdaExample {  
  
public static void main(String[] args) {  
SumFunction sumFunction = (a, b) -> a + b;  
int result = sumFunction.sum(3, 3);  
}  
}
```

**Functional interfaces** are Java interfaces that contain exactly one abstract method. They serve as the foundation for Lambda expressions.

## The world before Lambda

This is the same example rewritten as a standard anonymous inner class:

```
interface SumFunction {  
int sum(int a, int b);  
}  
  
SumFunction sumFunction = new SumFunction() {  
@Override  
public int sum(int a, int b) {  
return a + b;  
}  
};  
  
int result = sumFunction.sum(3, 3);
```

All functional interfaces implement exactly one method, which allows for syntactic sugar to implement that one method with much less code.
