

3. Adjust Compression Spring Tension

The initial tension on the ball spring assembly is adjusted by inserting a punch into the hole in the spring harness stud (B). To do this, turn the spring harness eye in or out to the spring harness stud (B). To do this, turn the spring harness eye in or out to the spring harness stud (B). Please note that the distance from center of spring harness eye to center of spring harness stud must be between 10.5 (3/4") and 10.7 (3/4").

However, changes in the spring tension will raise or lower the ball teeth in relation to the grate. The normal setting is such that the top of the ball teeth will come even with the top of the grate teeth when the grate is down. (As illustrated above.)

NOTE: Spring harness assemblies are factory preassembled to the dimensions given above.

Too loose a setting will result in the ball teeth striking the grate members under the grate teeth. Too tight a setting will cause the balls to tend over small rocks and frequent jamming will occur on larger rocks.

4. Lubrication

Before operating, grease all grease points thoroughly. There are twelve compression spring eyes, six ball joints, two rear bearings, and two ball bearings in the rear.

Also give a coat amount of 1540 20 on the drive chain.

7. Check that all nuts are tight, particularly the wheel bolts.

OPERATION

A. FIELD PREPARATION

The Model 3000 is designed to remove rocks from the surface of the soil and deposit them in the bucket.

It is not intended to be used to pick up boulders and attempting to do so could result in damage to the machine.

Ideally, the ground should be cultivated or chisel plowed to raise the rocks to the surface, and then, boulders to break up lumps of soil.

Hard lumps of soil will be picked up as if they were rocks.

A fairly firm and loose topsoil. After the initial preparation, it is desirable to let the ground set and "firm up" slightly.

In soft, sandy soils, the backhoe will tend to sink into the ground excessively, although it will not be operated under these conditions.

Excessive trash cover, such as straw, long weeds, etc., will tend to jam in the grate teeth and will result in excessive dirt being loaded.

B. PICKING ROCKS

1. Lower the grabber assembly until the shoes contact the frame. This will result in the cylinder eye joint at the grate being in the rear end of the shoe position.

This provides a bit of a cushion at the grate when "picking up" if it strikes a buried rock.

2. On ground drive models, a ground speed of about 0.5 - 5 miles per hour works best in most conditions. The backhoe will pick up the rocks up the grate and into the bucket.

Too high a speed will throw rocks over the bucket. Too low a speed will result in frequent jamming and wheel spinning problems.

3. On hydraulic drive models, the rear speed is independent of the ground speed. It can be adjusted as outlined earlier.

Too high a speed will result in rocks piling up against the front of the grate and frequent jamming or jamming will result.

4. CAUTION

a. Never attempt to operate the rock picker without all shields and guards in place.

b. Do not attempt to check or adjust the machine while it is in motion or while it is running.

c. Never allow anyone to ride on the machine or trailer while it is in motion.

d. Never allow anyone to stand near or approach the machine while it is picking due to possible flying rocks.

e. The machine operator should wear a safety helmet while using this unit.
