**Process and Operation Planning** G. Halevi, 2013-04-17 Process planning determines how a product is to be manufactured and is therefore a key element in the manufacturing process. It plays a major part in determining the cost of components and affects all factory activities: company competitiveness, production planning, production efficiency, and product quality. It is a crucial link between design and manufacturing. In spite of the importance of process planning in the manufacturing cycle, there is no formal methodology which can be used or can help to train personnel for this job. Process planning activities are predominantly labor intensive, depending on the experience and the skill and intuition of the planner, and therefore often precludes a thorough analysis and optimization of the process plan, which nearly always results in higher than necessary production costs, delays, errors, and non-standardization of processes. Process planning is regarded as an art and not a science. Research in the field of process planning has indicated that all experts have their own expertise and one expert's experience might be different from that of another. It is rare, therefore, for two planners to produce the same process. Each process will produce the part as specified, although different processes will result in different processing times and costs. The question is: who is an expert? By definition, an expert is one having or manifesting the knowledge, skill, and experience needed for success in a particular field or endeavor, or one who has acquired special skill in, or knowledge and mastery of, something.

Production & Operations Management Mayank Kumar Agrawal,2025-06-01 Printed circuit board assembly P.J.W. Noble,2013-03-09 Assembly of difficult components onto printed circuit boards is emerging as an important application area for small fast industrial robots For other robot tasks for example paint spraying or arc welding the applications engineer can rely on a body of published information representing decades of accumulated knowledge about the actual process being automated But for the process of assembly relatively little systematically presented knowledge exists mainly because so much manual assembly depends on extremely subtle co ordination of hand eye and brain which is hard to represent directly in engineering terms As for the particular processes of electronic assembly they have hardly been covered at all in the literature Yet the design of a good PCB automation system depends crucially on the responsible engineer fully understanding every aspect of the process he or she is automating whether working for the electronics manufacturer an automation company a research laboratory or a machine builder The author of this book has had extensive practical experience in all these roles as a source of great detail on most aspects of the electronic assembly process it will be of unique value not only to the robot specialist but well beyond that to anyone needing to understand how printed circuit boards are manufactured P G Davey Acknowledgements The author is indebted to many companies and individuals from within the pcb assembly industry
