Matrix Analysis Roger A. Horn, Charles R. Johnson, 1990-02-23 In this book the authors present classical and recent results for matrix analysis that have proved to be important to applied mathematics Facts about matrices beyond those found in an elementary linear algebra course are needed to understand virtually any area of mathematics and the necessary material has only occurred sporadically in the literature and university curricula As the interest in applied mathematics has grown the need for a text and a reference work offering a broad selection of topics has become apparent and this book aims to meet that need This book will be welcomed as an undergraduate or graduate textbook for students studying matrix analysis The authors assume a background in elementary linear algebra and knowledge of rudimentary analytical concepts They begin with a review and discussion of eigenvalues and eigenvectors The following chapters each treat a major topic in depth This volume should be useful not only as a text but also as a self contained reference work to a variety of audiences in other scientific fields

Non-Recursive Behavioural Models in Control Analysis and Design Mihail Voicu, Octavian Pastravanu, 2023-11-15 This book develops a nonstandard approach to control systems analysis and design exploring the properties of a new type of model called non recursive behavioural models unlike the recursive behavioural models of classical state space representation For a real plant exhibiting a linear behaviour in the vicinity of any operating point a non recursive behavioural model associated with an operating point is defined as a coherent collection of

appropriately selected input state transfers where for a given timeline the plant is actuated by piecewise constant input vectors This work successively presents mathematical preliminaries definitions of linear non recursive behavioural models techniques for state controllability analysis procedures for feedback control and optimal control design All theoretical results are illustrated by laboratory experiments This monograph is useful for postgraduate students research workers and practitioners interested in systems theory and its applications

Mathematical Methods for Protein Structure Analysis and Design Concettina Guerra, Sorin Istrail, 2003-06-25 The papers collected in this volume reproduce contributions by leading scholars to an international school and workshop which was organized and held with the goal of taking a snapshot of a discipline undergoing rapid growth Indeed the area of protein folding docking and alignment is developing in response to needs for a mix of heterogeneous expertise spanning biology chemistry mathematics computer science and statistics among others Some of the problems encountered in this area are not only important for the scientific challenges they pose but also for the opportunities they disclose in terms of medical and industrial exploitation A typical example is offered by protein drug interaction docking a problem posing daunting computational problems at the crossroads of geometry physics and chemistry and at the same time a problem with unimaginable implications for the pharmacopoeia of the future The school focused on problems posed by the study of the mechanisms hindering protein folding and explored different ways of attacking these problems under objective evaluations of the methods Together with a relatively small core of consolidated knowledge and tools important reactions were brought to this effort by studies in a multitude of directions and approaches It is obviously impossible to predict which if any among these techniques will prove completely successful but it is precisely the implicit dialectic among them that best conveys the current flavor of the field Such unique diversity and richness inspired the format of the meeting and also explains the slight departure of the present volume from the typical format in this series the exposition of the current state of the art is complemented here by a selection of qualified specialized contributions

Methods of Signal Processing for Adaptive Antenna Arrays Larysa Titarenko, Alexander Barkalov, 2012-08-23 So far there does not exist any theory of adaptive spatial signal processing ASSP for signals with uncertain parameters This monograph is devoted to the development of this theory which is very important in connection with wide spreading of telecommunications and radio links in the modern society This theory can be applied for the development of effective radio communications In the book some original approaches are proposed targeting the development of effective algorithms of ASSP with not exactly known parameters They include both probabilistic and deterministic approaches for synthesis of robust algorithms of ASSP The solution of problems also can be reduced to the construction of some operators for the Banach space which is presented in the book Methods of Signal Processing for Adaptive Antenna Arrays targets professionals students and PhD students in the area of telecommunications and should be useful for everybody connected with the new information technologies
