Other authors have argued that the observed pattern of results concerning strategies suggests that either a delay in working memory or a working memory deficit (Bjorklund, 1985) is the cause of the observed pattern. However, the present study of the development of the strategy of working memory suggests that the observed pattern of results is due to the development of the strategy of working memory.

**Fetal and Neonatal Pathology** Jean W. Keeling, 2013-03-09 Fetal and Neonatal Pathology presents in one volume an account of the pathological findings encountered when examining fetuses from the second and third trimester of pregnancy as well as in neonatal death. It provides essential clinical and physiological information and discusses the pathogenesis of pathological findings as a guide to the formulation of the appropriate method of investigation. The book is divided into two parts. The first deals with examination of the products of conception after termination of pregnancy for fetal anomaly. The range of pathological abnormality is described and its relevance discussed. Attention is drawn to the differences in pathological findings in specific conditions between the second and third trimester. The second part of the book is system orientated and describes and illustrates those pathological problems which are likely to be encountered in the fetus and neonate. Each chapter is introduced by a concise account of the development of that system. Where relevant there is also discussion of changes at birth as well as changes in normal function that may occur during the neonatal period. Fetal and Neonatal Pathology is primarily written for the morbid anatomist and histopathologist. It also provides a valuable source of reference for obstetricians, neonatologists and paediatricians. Its value as a working tool of reference is enhanced by effective cross referencing between sections by both chapter and page number. 1

Pathology of the Human Embryo and Previsible Fetus Dagmar K. Kalousek, Naomi Fitch, Barbara A. Paradice, 2013-03-09 This book is designed primarily for anatomic pathologists to facilitate their task of accurately diagnosing embryos and fetuses A detailed examination of the products of spontaneous and induced abortions is necessary for accurate genetic counseling and for

establishing the risk for specific abnormalities or another spontaneous pregnancy loss in the future. The growing interest in the defects of early development reflects the profound change in general life style. In the past spontaneous abortions were considered a common usually sporadic event in a patient's reproductive history. Only reassurance and encouragement were given to the patient and scant attention was paid to the detailed pathology of the abortus. Nowadays however as a result of reliable methods of contraception and of the availability of reliable prenatal diagnosis for chromosome abnormalities more frequent in advanced maternal age significant numbers of parents plan to have pregnancies later in their reproductive life. Consequently in a case of spontaneous abortion the question of cause and of future risk of recurrence of abortion or an abnormal infant is particularly important. In the era of more elaborate and accurate prenatal diagnostic tests the pathologist examining products of conception has a primary responsibility to detect in both spontaneous and induced abortions any developmental abnormality that would indicate an increased risk of multifactorial chromosomal and single gene disorders in a subsequent child.
