**Processor Architecture** Jurij Silc, Borut Robic, Theo Ungerer, 2012-12-06 Today's microprocessors are the powerful descendants of the von Neumann 1 computer dating back to a memo of Burks Goldstine and von Neumann of 1946 The so called von Neumann architecture is characterized by a sequential control flow resulting in a sequential instruction stream A program counter addresses the next instruction if the preceding instruction is not a control instruction such as e.g. jump branch subprogram call or return An instruction is coded in an instruction format of fixed or variable length where the opcode is followed by one or more operands that can be data addresses of data or the address of an instruction in the case of a control instruction The opcode defines the types of operands Code and data are stored in a common storage that is linear addressed in units of memory words bytes words etc The overwhelming design criterion of the von Neumann computer was the minimization of hardware and especially of storage The most simple implementation of a von Neumann computer is characterized by a microarchitecture that defines a closely coupled control and arithmetic logic unit ALU a storage unit and an I/O unit all connected by a single connection unit The instruction fetch by the control unit alternates with operand fetches and result stores for the ALU
