

Chemistry – Unit 5 Worksheet 1

Relative Mass

Relative Mass from Gases

We have established that the combining ratio of gases can be explained if two assumptions are made:

1. Equal volumes of gases contain the same number of molecules at the same pressure and temperature.
2. Some pure elemental gases are clustered into pairs to form diatomic molecules.

Use these assumptions and particle diagrams to explain the fact that the density of oxygen gas at standard temperature and pressure is 1.43 g/L, whereas the density of hydrogen gas under these conditions is 0.089g/L. How many times more massive is one molecule of oxygen than one molecule of hydrogen?

You shouldn't conclude that chemists were able to determine the molar masses of all elements using this technique. Measurements of the density of the gaseous phase of many of the elements are difficult, if not impossible. However, we are going to see that chemists use another tool – the *percent composition of compounds* to determine molar masses.

Relative Mass from Compounds

Many substances combine with oxygen to form a type of compound called an oxide. We have already seen that such combinations often occur in multiple proportions. John Dalton made the assumption that the lowest mass ratio that could be found for a compound was achieved when the elements combined in a 1:1 combination. For now, we will make a similar assumption.

In Unit 4 you examined the percent composition data of several compounds. For example, 100 g of the simplest oxide of carbon contains 42.9 g of carbon and 57.5 g of oxygen. It is helpful when comparing masses of elements, to compare them to the same mass of oxygen. Using a proportion, one can show that 75.0 g of carbon combines with 100 g of oxygen.

$$\frac{42.9\text{g C}}{57.1\text{g O}} = \frac{75.0\text{g C}}{100\text{g O}}$$
