A Guide for Achieving Flexibility in Highway Design, 2004 Context sensitive solutions CSS reflect the need to consider highway projects as more than just transportation facilities Depending on how highway projects are integrated into the community they can have far reaching impacts beyond their traffic or transportation function CSS is a comprehensive process that brings stakeholders together in a positive proactive environment to develop projects that not only meet transportation needs but also improve or enhance the community Achieving a flexible context sensitive design solution requires designers to fully understand the reasons behind the processes design values and design procedures that are used This AASHTO Guide shows highway designers how to think flexibly how to recognize the many choices and options they have and how to arrive at the best solution for the particular situation or context It also strives to emphasize that flexible design does not necessarily entail a fundamentally new design process but that it can be integrated into the existing transportation culture This publication represents a major step toward institutionalizing CSS into state transportation departments and other agencies charged with transportation project development

TRB, 2011-10-15 Comprehensive Engineering Approach to Achieving Safe Neighborhoods

James A. Bonneson, Angelia H. Parham, Karl Zimmerman, 2000 Steady increases in travel demand coupled with minimal increases in arterial street capacity have led to an increase in traffic related safety problems in residential neighborhoods These problems stem from the significant number of motorists that divert from the arterial to the residential street system in an effort to avoid arterial related delays Diverted motorists add to neighborhood traffic volumes and increase crash exposure for pedestrians bicyclists and other vehicles In addition diverted motorists often drive at excessive speed which increases both the potential for a crash and its severity The objective of this research was to develop guidelines for the use of both neighborhood traffic management and corridor traffic management techniques that have the potential to reduce speed or cut through volume on the local street system The approach taken to conduct this research was to develop as much of the guideline material through a synthesis of the literature and to supplement this synthesis with some investigative research in areas where information was lacking A model was developed for this research that can predict the percent of arterial drivers that cut through the adjacent neighborhood streets The data used to develop this model were obtained from extensive simulations of a typical city street system that includes arterial collector and local streets The model variables include average arterial travel speed signal density in signals per mile and the degree of saturation of the signalized intersections on the arterial Percent cut through traffic was found to range from 0.0 to 30% of the arterial volume with the higher percentage

associated with oversaturated signalized intersections Several recommendations for future research in the area of traffic management techniques were developed Fundamentally it is recommended that additional research be conducted on the effectiveness of alternative traffic management techniques For neighborhood traffic management techniques before and after data are needed to assess technique effectiveness in terms of volume reduction speed reduction and crash reduction For corridor traffic management further research efforts are necessary to verify the accuracy of the cut through traffic prediction model developed for this research
