**Development of Novel Bioelectrochemical Membrane Separation Technologies for Wastewater Treatment and Resource Recovery** Yunkun Wang, 2020-03-30. The most commonly used biological wastewater treatment technologies still have serious technical, economical, and sustainability related limitations due to their high energy requirements, poor effluent quality, and lack of energy and resource recovery processes. In this thesis, novel electrochemical membrane bioreactors (EMBRs) which take advantage of membrane separation and bioelectrochemical techniques are developed for wastewater treatment and the simultaneous recovery of energy and resources. Above all, this innovative system holds great promise for the efficient wastewater treatment and energy recovery. It can potentially recover net energy from wastewater while at the same time harvesting high quality effluent. The book also provides a proof of concept study showing that electrochemical control might offer a promising in situ means of suppressing membrane fouling. Lastly, by integrating electrodialysis into EMBRs, phosphate separation and recovery are achieved. Hence, these new EMBR techniques provide viable alternatives for sustainable wastewater treatment and resource recovery.

Organizational Engineering in Industry 4.0 David De la Fuente, Raúl Pino, Borja Ponte, Rafael Rosillo, 2021-05-15. The book includes the latest research advances and cutting edge analyses of real case studies in the disciplines of Industrial Engineering and Operations Management from
