Analog Circuit Design Rudy J. van de Plassche, Willy M.C. Sansen, Johan Huijsing, 2013-06-29 The realization of signal sampling and quantization at high sample rates with low power dissipation is an important goal in many applications including portable video devices such as camcorders personal communication devices such as wireless LAN transceivers in the read channels of magnetic storage devices using digital data detection and many others This paper describes architecture and circuit approaches for the design of high speed low power pipeline analog to digital converters in CMOS Here the term high speed is taken to imply sampling rates above 1 Mhz In the first section the dif

ferent conversion techniques applicable in this range of sample rates is discussed Following that the particular problems associated with power minimization in video rate pipeline ADCs is discussed These include optimization of capacitor sizes design of low voltage transmission gates and optimization of switched capacitor gain blocks and operational amplifiers for minimum power dissipation As an example of the application of these techniques the design of a power optimized 10 bit pipeline A/D converter ADC that achieves 1.67 mW per MS/s of sampling rate from 1 MS/s to 20 MS/s is described

2 Techniques for CMOS Video Rate A/D Conversion Analog to digital conversion techniques can be categorized in many ways One convenient means of comparing techniques is to examine the number of analog clock cycles required to produce one effective output sample of the signal being quantized
