

The Digestive System - Structure and Function

The mouth is where digestion begins with the **teeth, tongue and the salivary glands.**

We **teeth** chew food to begin mechanical digestion. The **tongue** moves the food around to mix it with saliva from the **salivary glands** for the start of the chemical breakdown of starchy foods.

When you swallow food, it goes down into the **esophagus**, a long, muscular tube about 10 inches long (25 cm) to the stomach.

The **stomach** is a storage tank for digesting food. It does both mechanical and chemical digestion and it churns the food and mixes it with the gastric juices.

The **pancreas** makes an enzyme that lowers the acidity of the food coming out of the stomach into the small intestine. It also makes insulin, which lowers sugars in the bloodstream.

The **small intestine** is a long tube where digestion is completed and all the food nutrients are absorbed into the blood. The **large intestine** absorbs any left over water, vitamins and electrolytes (like sodium and chloride) in the food waste passing through it.

The **liver** and the **gall bladder** are accessory organs of the small intestine. The liver makes bile, which breaks down fat and stores it in the gall bladder. The liver also filters the blood and stores vitamins and nutrients for when the body needs them.

Middle School Life Science Judy Capra, 1999-08-23 Middle School Life Science Teacher's Guide is easy to use. The new design features tabbed loose sheets which come in a stand up box that fits neatly on a bookshelf. It is divided into units and chapters so that you may use only what you need. Instead of always transporting a large book or binder or box you may take only the pages you need and place them in a separate binder or folder. Teachers can also share materials. While one is teaching a particular chapter another may use the same resource material to teach a different chapter. It's simple it's convenient.
