

11.41 Tighten and hold in the gasket (previously, which indicates the gasket's thickness

11.42 Using a feeler blade to measure the gasket protrusion

11.43 Locate the new cylinder head gasket over the downer correctly

16. If the same face as the old one. Measure the required gasket, and proceed to step 20.

20. If the head has been machined, or if new pistons have been fitted, it is likely that a head gasket of different thickness to the original will be needed. Gasket selection is made on the basis of the measured piston protrusion above the cylinder head gasket surface the protrusion that fit within the range specified at the start of this Chapter.

24. To measure the piston protrusion, insert a new feeler indicator (0.75) in the top two cylinder head gasket mating faces of the cylinder block, and use the gauge on the gasket mating face (see illustration).

26. Test the gauge probe above the 1. cylinder piston, and turn the graduated scale to read with the piston reaching 75% its maximum height. Measure and record the maximum piston protrusion at 75%.

28. Repeat the measurement for the remaining pistons, and record the results.

29. If the measurements differ from piston to piston, take the highest figure, and use this to determine the thickness of the head gasket required (see the Specifications at the start of this Chapter).

Preparation for refitting

30. The mating faces of the cylinder head and cylinder block must be perfectly clean before refitting the head. Use a hand plane or power sander to remove all traces of gasket and carbon, and cover the piston crowns.

Note: The new head gasket has rubber coated surfaces, which could be damaged from steel scrap or debris left in a water channel.

31. Test pistons (and other) ensuring the piston crowns, on the left aluminium alloy, is easily damaged.

32. Make sure that the carbon is not allowed

to enter the oil and water passages. This is particularly important for the lubrication system, as carbon could block the oil supply to the engine's components, using adhesive tape with caution, seal the water, oil and fuel holes in the cylinder block.

33. To prevent carbon entering the gas passages the pistons and rods, allow a little grease in the gas. After covering each piston, use a small brush to remove all traces of grease and carbon from the gas. Then wipe away the remainder with a clean rag. Clean all the pistons in the same way.

34. Check the mating surfaces of the cylinder block and the cylinder head for holes, deep scratches and other damage, refer to the text in paragraph 10. If signs of this may be removed carefully with a file, but if necessary, machining may be the only alternative to be taken.

35. If a surface of the cylinder head gasket surface is damaged, use a straight edge to check it for distortion. Refer to Part 2, of this Chapter 2.1.1.

36. Ensure that the cylinder head bolt holes in the intermediate are clean and free of oil. Springs in both cavity of oil in the bolt holes. This is most important to ensure that the correct bolt tightening torque can be applied, and to prevent the possibility of the block being cracked by hydraulic pressure when the bolts are tightened.

Refitting

37. Wipe away the timing oil with a 500-6000 grit flannel. Do this with extreme care, as the cylinder head is oil-fitted.

38. To guide the cylinder head into position, screw the long studs into the end cylinder head bolt locations on the marked side of the cylinder block. As an alternative to the studs, use old cylinder head bolts with their heads cut off, and screw in to the ends to enable the bolts to be unscrewed.

39. Ensure that the cylinder head mounting flanges are in place in the cylinder block, then fit the new cylinder head gasket over the downer (see illustration). The gasket can only be fitted one way, with the bolt to determine the gasket thickness at the front (see illustration 11.43). Then use it to avoid damaging the gasket's rubber coating.

11.44 Remove the wiring

11.45 Disconnect the wiring connector from the opposite lighter

11.46 Lift out the storage tray from the top of the block

11.47 Under the four bolts (previously) securing the head, insert the mounting bracket in the block

11.48 Release the retaining clip, and remove the head from the top of the conditioned only further from the mounting bracket

11.49 Then remove the bracket

40. Working through the storage tray, separate under the four bolts securing the brackets, and mounting bracket in the block (see illustration).

41. Release the retaining clip and detach the head from the top of the cylinder block, then remove the mounting bracket. Then remove the bracket (see illustration).

42. Disconnect the wiring connector from the power point.

43. Lift off the two covers and remove the head upper retaining bolts (see illustration).

44. Under the six bolts securing the head, insert small support (shown in the illustration) (see illustration).

45. Release the retaining clip and remove the head upper from the block on both sides (see illustration).

46. Using a small screwdriver, release the

both covers from the face on both sides (see illustration).

11.49 Lift off the two covers

47. Under the four outer mounting bolts from the face on both sides (see illustration).

11.50 Then remove the four upper retaining bolts

11.51 Under the six bolts (previously) securing the head, insert the support bracket in the block

11.52 Release the retaining clip and remove the head upper from the face on both sides

11.53 Using a small screwdriver, release the bolt covers from the face on both sides

11.41 Tightening sequence for the cylinder head bolts
