

time required to complete an 80% controller for each value of the planning factor β .

The three controllers achieve closed-loop H_2 norms of 0.04, 0.07 and 0.03, respectively. Computed closed-loop modes and compare the gains from road disturbance to y_1, y_2, y_3 for the passive and active systems. It is clear that all three controllers reduce suspension deflection and body acceleration below the set points.

Abstract

Do not you have designed $\hat{H}_n$ controller that meet the performance objectives for the nominal value discussed earlier. This model is only an approximation of the true structure and you need to make sure performance is maintained in the face of model errors and uncertainties. This is called robust performance. Next you μ -synthesize to design μ -controller that achieves robust performance for the entire family of μ -nominal controllers is synthesized with the design function using the structured singular value μ , i.e., μ of "worst-case" performance ($\mu < 0.1$).
