- After experiencing extreme fatigue and polyuria, a patient's basic metabolic panel is analyzed in the laboratory. The result of the glucose is too high for the instrument to read. The laboratorian performs a dilution using 0.25 mL of patient sample to 750 microliters of diluent. The result now reads 325 mg/dL. How should the techologist report this patient's glucose result?

- A. 325 mg/dL
- B. 1300 mg/dL
- C. 975 mg/dL
- D. 1625 mg/dL

**A;**

Conversion of only the slant to a pink color in a Christensen's urea agar slant is produced by bacterial species that have weak urease activity. The reaction in the slant to the right is often produced by *Klebsiella* species, as an example. Strong urease activity is indicated by conversion of the slant and the butt of the tube to a pink color, as seen in the tube to the left. The slant only reaction in the right tube may be seen early on if only the slant had been inoculated; however, with a strong urease producer, both the slant and the butt would turn. Therefore, the reaction is dependent on the strength of urease activity. If the media had outdated for a prolonged period, either there would be no reaction or the appearance of only a faint pink tinge, either in the slant, the butt or both, again depending on the strength of urease production by the unknown organism.

- The urease reaction seen in the Christensen's urea agar slant on the far right indicates:

- A. Weak activity
- B. Strong activity
- C. Slant only inoculated
- D. Use of outdated medium

**D;**

The steps in the PCR process are:

1. Denaturation (Turning double stranded DNA into single strands.)
2. Annealing/Hybridization (Attachment of primers to the single DNA strands.)
3. Extension (Creating the complementary strand to produce new double stranded DNA.)

- What is the first step of the PCR reaction?

- A. Hybridization
- B. **Extension**
- C. Annealing
