Representative Volume Elements and Unit Cells Shuguang Li, Elena Sitnikova, 2019-11-19 Numerical methods to estimate material properties usually involve analysis of a representative volume element RVE or unit cell UC The representative volume element RVE or unit cell UC is the smallest volume over which a measurement can be made that will yield a value representative of the whole RVEs and UCs are widely used in the characterisation of materials with multiscale architectures such as composites However finite element FE software packages such as Abaqus and Comsol MultiPhysics do not offer the capability for RVE and UC modelling directly on their own To apply them to analyse RVEs and UCs the generation of the FE models for them the imposition of boundary conditions and the extraction of directly relevant results are essentially the responsibility of the user These have tended to be incorrectly implemented by users For the first time this book will provide a comprehensive account on correct modelling of RVEs and UCs which will eliminate any uncertainties and ambiguities The book offers a complete and thorough review on the subject of RVEs and UCs establishing a framework on a rigorous mathematical and mechanical basis to ensure that basic concepts such as symmetry and free body diagrams are applied correctly and consistently It also demonstrates to readers that rigorous applications of mathematics and mechanics are meant to make things clear consistent thorough and most of all simple and easy to follow rather than the opposite as many perceive As a result the book shows that the appropriate use of RVEs and UCs can deliver an effective and reliable means of material characterisation It not only provides a much needed comprehensive account on material characterisation but more importantly explains how such characterisation can be conducted in a consistent and systematic manner It also includes a ready to use open source code for UCs that can be downloaded from a companion site for potential users to utilise adapt and expand as they wish The companion site for the book can be found at <https://www.elsevier.com/books-and-journals/book-companion/9780081026380> The theories presented in this book will give users more confidence when applying RVE and UC models to analyse materials of complex architectures with accuracy and efficiency Systematic explanations of RVE and UC theories have been included as well as their applications in composites It illustrates in detail how to set up UC models and provides an open source code to implement via Abaqus

Rajeshwari,Hema Singh,Raveendranath U. Nair,2020-09-12 This book presents a novel methodology for the computation of RCS of metallic structures using a parallelized version of NEC in conjunction with a finite element preprocessor which has been strategically incorporated for simplifying geometry modelling catering to NEC guidelines It includes a thorough overview of the theoretical background of NEC including all relevant aspects of formulation and modelling The revised methodology including all the required steps and details is discussed elaborately along with case studies and validations This book will serve as a valuable resource for students researchers scientists and engineers working in the field of RCS predictions and measurements

Proceedings of the 1st International Conference on New Materials, Machinery and Vehicle Engineering Jinyang Xu,Yukui Cai,Mohamed El Mansori,2022-05-15 New materials are constantly being developed which may improve or transform many aspects of our lives and nowhere is this more exciting than in the fields of vehicle and machinery technology This book presents the proceedings of the 2022 International Conference on New Materials Machinery and Vehicle Engineering NMMVE 2022 held as a virtual event due to the COVID 19 pandemic and travel restrictions from 18 20 March 2022 NMMVE 2022 provides an international forum for researchers and engineers to present and discuss recent advances new techniques and applications in the fields of new materials machinery and vehicle engineering and attracts academics scientists engineers postgraduates and other professionals from a wide range of universities and institutions A total of 121 submissions were received from which 48 were accepted for inclusion in the conference and proceeding after a rigorous standard single blind reviewing process The papers are grouped into 3 sections machinery 30 papers new materials 11 papers and vehicle engineering 7 papers Providing an overview of the latest developments in these fields the book will be of interest to all those wishing to know more about new materials and machine and vehicle engineering

Properties and Characterization of Modern Materials Andreas Öchsner,Holm Altenbach,2016-07-30 This book focuses on robust characterization and prediction methods for materials in technical applications as well as the materials safety features during operation In particular it presents methods for reliably predicting material properties an aspect that is becoming increasingly important as engineering materials are pushed closer and closer to their limits to boost the performance of machines and structures To increase their engineering value components are now designed under the consideration of their multiphysical properties and functions which requires much more intensive investigation and characterization of these materials The materials covered in this monograph range from metal based groups such as lightweight alloys to advanced high strength steels and modern titanium alloys Furthermore a wide range of polymers and composite materials e g with micro and nanoparticles or fibres is covered The book explores methods for property prediction from classical mechanical characterization related fields of application for example from wear creep fatigue and crack growth to specific surface properties to dielectric and electrochemical values As in all fields of modern engineering the process is often accompanied by numerical simulation and optimization

Arch Bridges A. Sinopoli, 2020-12-17 Modern structural engineering surprises us with the mastery and certainty with which it plans and carries out daring projects such as the most recent metal or concrete bridges whether they be suspension or arch bridges On the other hand little is yet known about the state of knowledge of construction science and techniques which well before the arrival of modern methods based on the mechanics of deformable continua made it possible in the past to erect the vaulted masonry structures that we have inherited The fact that these have lasted through many centuries to our time and are still in a fairly good state of conservation makes them competitive as far as stability and durability are concerned with those constructed in other materials Although it is known that the equilibrium of the arch is guaranteed by any funicular whatsoever of the loads contained inside the profile of an arch finding the unique solution is not such a certainty In other words the problem of the equilibrium of vaulted structures is Poleni's problem the one for which the Venetian scientist was able to give an exemplary solution on the occasion of the assessment of the dome of St Peter's Arch Bridges focuses on the main aspects of the debate about the masonry arch bridge History of structural mechanics and construction theoretical models analysis for assessment numerical methods experimental and non destructive testing maintenance and repair are the topics of the Conference The breadth and variety of the contributions presented and discussed by leading experts from many countries make this volume an authoritative source of up to date information

Customized Artificial Implants: Bionic Design and Multiscale Evaluation Zhenxian Chen, Yongtao Lyu, Junyan Li, Xijin Hua, 2024-05-24 Artificial implants have been commonly used to replace or fix damaged tissue in orthopedics However due to the inter individual differences and the complexities of anatomical structures and load conditions traditional implants cannot

meet the clinical requirements In recent years questions relating to customized artificial implants have been getting more and more attention from the research community Challenges to implementing precision design and evaluation arise not only from the design need of considering bionic structures kinematical function mechanical performances and biological functional similarity but also from the multiscale comprehensive evaluation the latter involves biomechanics and biotribology of musculoskeletal systems from macro musculoskeletal multibody dynamics to micromechanics of porous structures Established analysis technologies such as musculoskeletal multibody dynamics modeling and neuromusculoskeletal modeling are being well developed and evolved through combining coupling with finite element analyses and more recently by novel artificial intelligence approaches
