By scientifically understanding how different components

degrade during operations it is possible to schedule inspections repairs and overhauls at appropriate intervals so that any incipient failure can be detected well in advance Today this includes more sensors and analytics so that periodic inspections are replaced by automated continuous inspections and analytical methods that detect imminent failures and predict degradation issues more economically and efficiently Similar concepts are also being developed for delivering prognostics functions such as tracking of remaining useful life RUL of life limited parts in aircraft engines The discipline within CBM that deals with this is called prognostics and health management PHM which covers all aspects of diagnostics and prognostics including modeling of systems and subsystems sensing data transmission storage and retrieval analytical methods and decision making Traditionally nondestructive testing NDT methods have been employed during the major airplane checks to assess structural damage These techniques are enhanced with in situ sensing techniques that can continuously monitor aircraft structures and report on their health The move to condition based assessment of maintenance needs to be balanced by the assurance that safety is not compromised that initial cost of new equipment is amortized by the savings and that regulatory authorities are on board with any modifications to the planned maintenance schedule The trend is clearly to include more CBM functions into Maintenance Repair and Overhaul MRO processes so better cost control can be achieved without ever comprising passenger safety
