The biology and ecology of ticks shape the potential for the transmission of zoonotic pathogens. Agustín Estrada-Peña, Jose De La Fuente, 2015-02-24 Ticks are noticeable by the high diversity of pathogens they can transmit most of them with implications in human and animal health Ticks are arachnids meaning that they do not share the biological and ecological features of the mosquitoes and other parasitic Diptera The natural foci of tick borne pathogens may be as large as a continent or be restricted to small portions of a country without apparently too many similar features The life cycle of the ticks involved three developing instars The precise relationships of ticks and their hosts the specific seasonal pattern of activity of ticks and the still poorly known molecular relationships between ticks and the pathogens they can transmit make these vectors a specially fecund field of research Importantly extensive studies on the biological and ecological relationships of ticks and abiotic climate and vegetation conditions have revealed the fine tuning of the ticks and the pathogens they transmit together with the biological effects of host and the driving features by the climate The studies on tick transmitted pathogens have been on the rise in the last years There is a growing interest in understand the somewhat complex relationships between the landscape the climate the vectors and the pathogens because the concerns of spread probably driven by subtle changes in climate and man made alterations of the landscape Studies on Lyme borreliosis are addressing the interesting issue of the relationships between the climate the tick activity patterns and the selection of strains according to the reservoir availability Furthermore the expanding field of habitat suitability modeling has been applied with different degrees of success to evaluate and quantify the risk of disease transmission In such exponentially growing field revisionary books are clearly welcome additions to the bibliographical tools of researchers It is however necessary the compilation of works devoted to explore the tip of the iceberg in the field of research In this Research Topic we wish to summarize and review the studies on ecology molecular biology and tick host pathogens interactions provided to resolve the important issues of ticks and pathogens We want not only the results obtained by newly developed molecular tools but rigorous reviews of the most recent advances in these issues This Topic will cover aspects of both human and animal health with special interest on zoonoses Aspects of the biology of the ticks as affecting the transmission of pathogens are of special interest in this Topic Studies on ticks of the poorly known family Argasidae as related to their involvement on pathogen transmission are especially welcome We also wish to describe the perspective of the field in the future Finally the presentation of ongoing original works is greatly encouraged

Parasitoid Population Biology Michael E. Hochberg, Anthony R. Ives, 2021-05-11 Extraordinary in the diversity of their lifestyles insect parasitoids have become extremely important study organisms in the field of population biology and they are the most frequently used agents in the biological control of insect pests This book presents the ideas of seventeen international specialists providing the reader not

only with an overview but also with lively discussions of the most salient questions pertaining to the field today and prescriptions for avenues of future research After a general introduction the book divides into three main sections population dynamics population diversity and population applications The first section covers gaps in our knowledge in parasitoid behavior parasitoid persistence and how space and landscape affect dynamics The contributions on population diversity consider how evolution has molded parasitoid populations and communities The final section calls for novel approaches toward resolving the enigma of success in biological control and questions why parasitoids have been largely neglected in conservation biology Parasitoid Population Biology will likely be an important influence on research well into the twenty first century and will provoke discussion amongst parasitoid biologists and population biologists In addition to the editors the contributors are Carlos Bernstein Jacques Brodeur Jerome Casas H C J Godfray Susan Harrison Alan Hastings Bradford A Hawkins George E Heimpel Marcel Holyoak Nick Mills Bernard D Roitberg Jens Roland Michael R Strand Teja Tschamntke and Minus van Baalen

The Biology and Conservation of Wild Canids David W. Macdonald, Claudio

Sillero-Zubiri, 2004-06-24 No group of wild mammals so universally captures the emotions of people world wide than do wild canids That emotion can be enchantment and fascination but it can also be loathing because the opportunism that is the hallmark of the dog family also leads them into conflict with humans In the developed world at least the fascination with wild canids doubtless stems from people's captivation with domestic dogs everybody feels they are an expert on canids While most people may be familiar with only the better known members of the dog family such as the grey wolf and the red fox there are in fact 36 species of wolves dogs jackals and foxes They attract hugely disproportionate interest from academics conservationists veterinarians wildlife managers and the general public This book brings together in single volume an astonishing synthesis of research done in the last twenty years and is the first truly compendious synthesis on wild canids Beginning with a complete account of all 36 canid species there follow six review chapters that emphasise topics most relevant to canid conservation science including evolution and systematics behavioural ecology population genetics diseases conflict control of troublesome species and conservation tools Fifteen detailed case studies then delve deeply into the very best species investigations currently available written by all the leading figures in the field Much of the material is previously unpublished and will make fascinating reading far beyond the confines of canid specialists These chapters portray the unique attributes of wild canids their fascinating and conflictive relationship with man and suggestions for future research and conservation measures for the Canidae While most canid species are widespread and thrive in human dominated landscapes several are in severe jeopardy habitat loss illegal hunting persecution by farmers and disease all imperil dwindling populations A final chapter analyses the requirements of and approaches to practical conservation with lessons that go far beyond the dog family It concentrates particular attention on priorities for the protection of the most threatened canid species including the red wolf African wild dog Ethiopian wolf Island fox and Darwin's fox The wild canids provide examples

that will thrill the evolutionary biologists and theoretician enthral the natural historian and challenge the conservationist and wildlife manager Anybody interested in evolutionary and behavioural biology in mammals in the environment or in conservation will find much that is new and enriching in this book *Metacommunity Spatio-Temporal Dynamics: Conservation and Management Implications* Pedro Giovâni Da Silva, Jani Heino, Juliano André Bogoni, Miguel Cañedo-Argüelles, 2021-05-18
