1. The system is designed to control the motor speed and position. It uses a feedback loop to maintain the desired setpoint. The control algorithm is implemented in a digital controller, which outputs a PWM signal to the motor driver. The motor driver consists of a power MOSFET and a diode, which switch the motor current. The motor is a DC brushless motor, which is known for its high efficiency and long life. The system is powered by a 24VDC supply, which is regulated to 5VDC for the control electronics. The motor is connected to the power supply through a fuse and a circuit breaker for protection. The system is tested and calibrated before use. The test results show that the system can control the motor speed and position with high accuracy and stability. The calibration is done by adjusting the gain and offset of the control algorithm. The system is ready for use.
